A CRM APPLICATION FOR THECHAISHOP&CO

User Story:

The Customer Relationship Management (CRM) application for TheChaiShop&Co is designed to improve the efficiency of sales representatives by simplifying customer relationship management and streamlining the sales process. The system enables sales representatives to easily access, manage, and update customer and employer information within a centralized platform. This helps ensure that customer records remain accurate and up to date.To enhance customer management, the application utilizes record types to differentiate between online and offline customers. This classification allows sales representatives to maintain organized records and provide more personalized interactions based on the customer's purchasing channel.

1. INTRODUCTION

1.1 Project Overview :

The Customer Relationship Management (CRM) application project “A CRM Application for TheChaiShop&Co” focuses on developing a Salesforce-based Customer Relationship Management (CRM) The system to manage customer, employer, and enterprise accounts efficiently. The system automates sales processes, maintains customer records, generates reports, and improves customer engagement through automated notifications.

The project user story and objectives are defined in the initial section of the document

1.2 Purpose :

The purpose of this project is to:

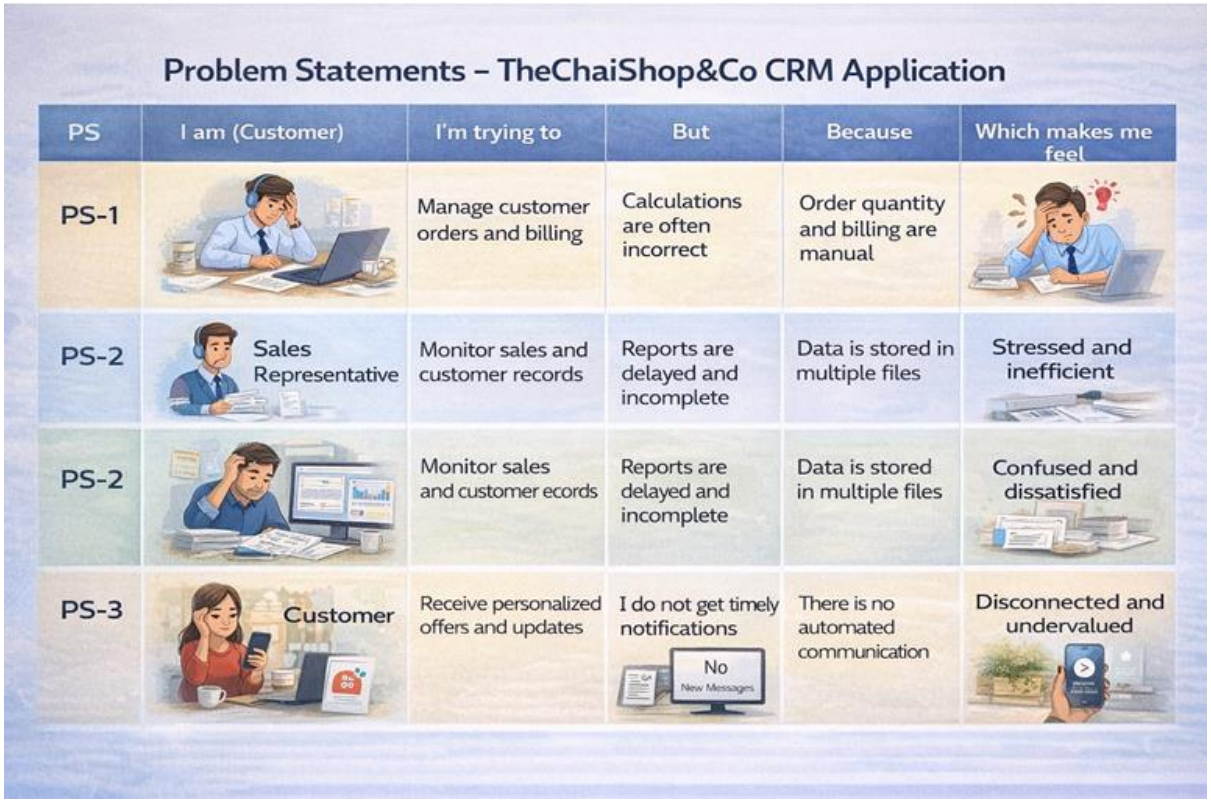
- Streamline customer relationship management
- Automate billing and order calculations
- Improve data accuracy

- Enable data-driven decision-making
- Enhance customer engagement through email automation

2. IDEATION PHASE

2.1 Problem Statement (Customer Problem Statement Template)

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	Sales Representative	Manage customer orders and billing	Calculations are often incorrect	Order quantity and billing are manual	Stressed and inefficient
PS-2	Store Manager	Monitor sales and customer records	Reports are delayed and incomplete	Data is stored in multiple files	Confused and dissatisfied
PS-3	Customer	Receive personalized offers and updates	I do not get timely notifications	There is no automated communication	Disconnected and undervalued



Problem Statements – TheChaiShop&Co CRM Application

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1		Manage customer orders and billing	Calculations are often incorrect	Order quantity and billing are manual	
PS-2	Sales Representative	Monitor sales and customer records	Reports are delayed and incomplete	Data is stored in multiple files	Stressed and inefficient
PS-2		Monitor sales and customer ecords	Reports are delayed and incomplete	Data is stored in multiple files	Confused and dissatisfied
PS-3	Customer	Receive personalized offers and updates	I do not get timely notifications	There is no automated communication	Disconnected and undervalued

2.2 Empathy Map Canvas

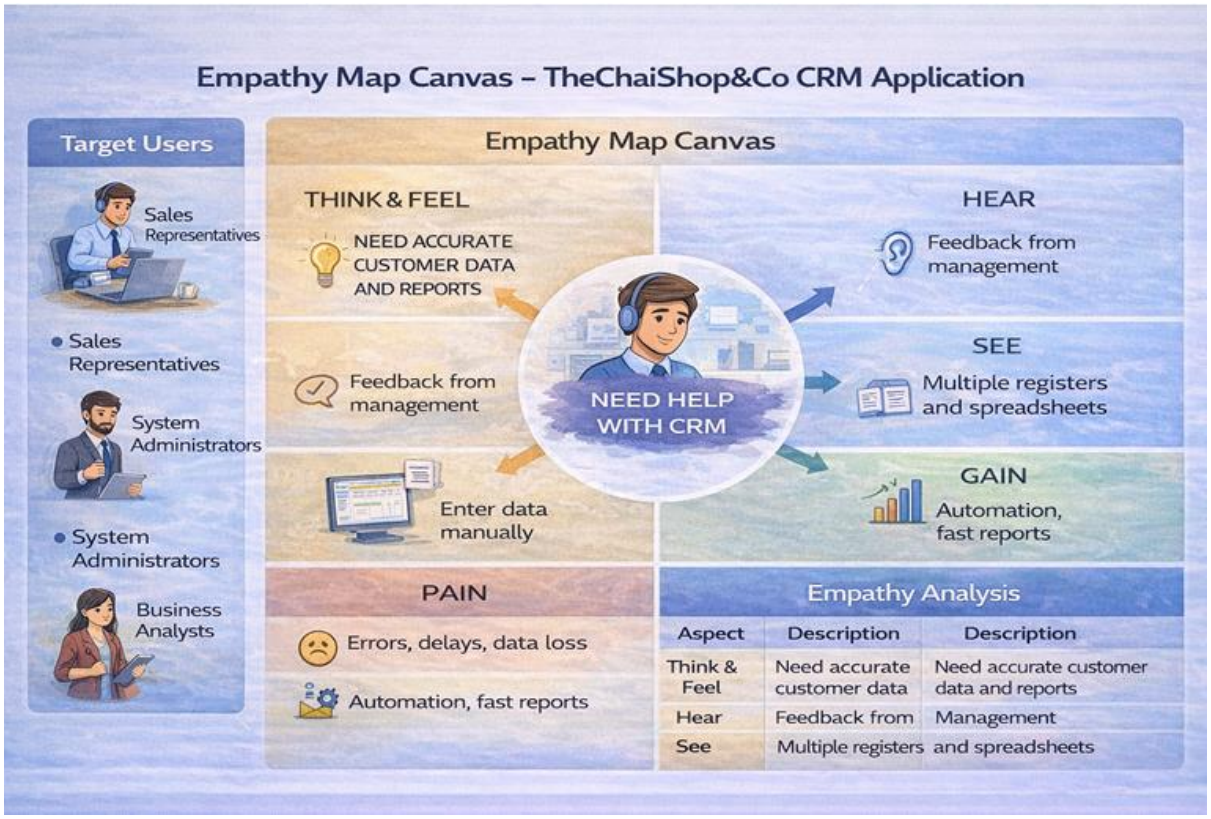
Target Users

- Sales Representatives
- Managers
- System Administrators
- Business Analysts

Empathy Analysis

Aspect	Description
Think & Feel	Need accurate customer data and reports
Hear	Feedback from management
See	Multiple registers and spreadsheets
Say & Do	Enter data manually

Pain	Errors, delays, data loss
Gain	Automation, fast reports



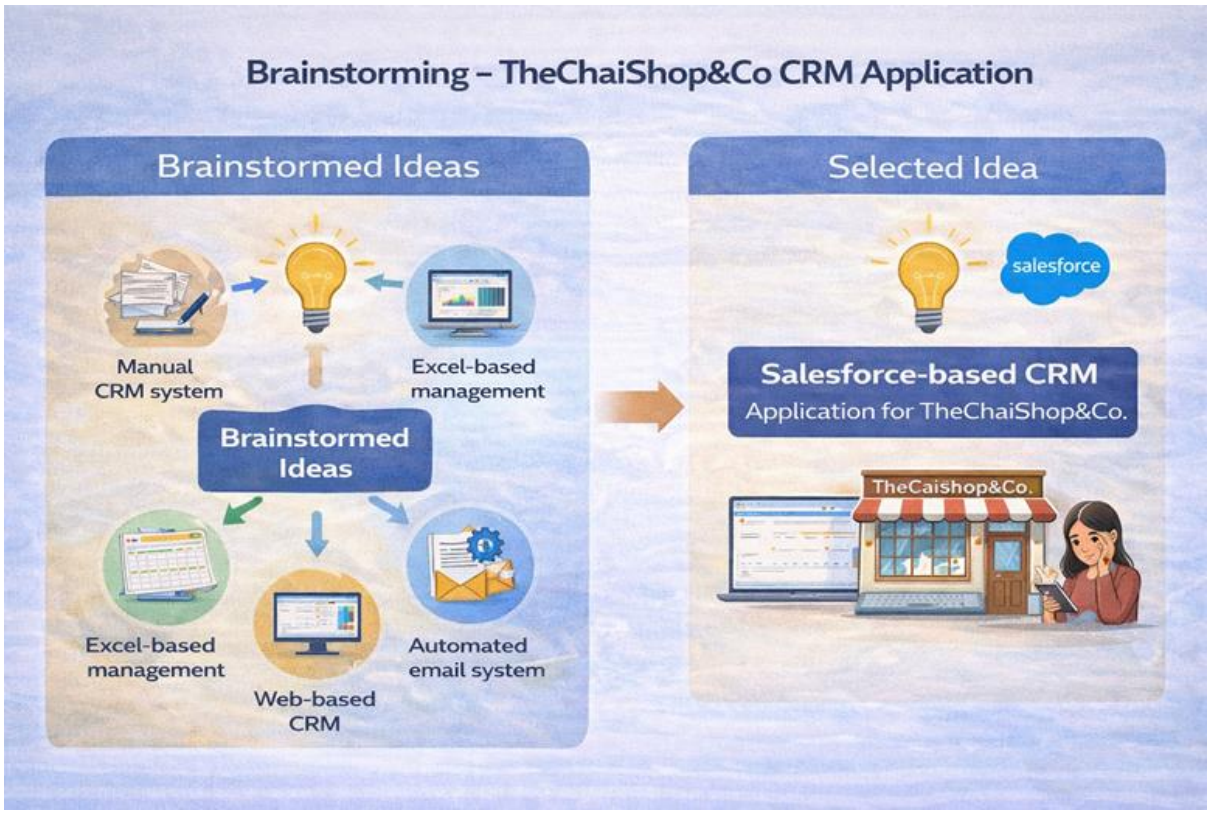
2.3 Brainstorming

Brainstormed Ideas

- Manual CRM system
- Excel-based management
- Web-based CRM
- Salesforce-based CRM
- Automated email system

Selected Idea:

Salesforce-based CRM Application for TheChaiShop&Co..



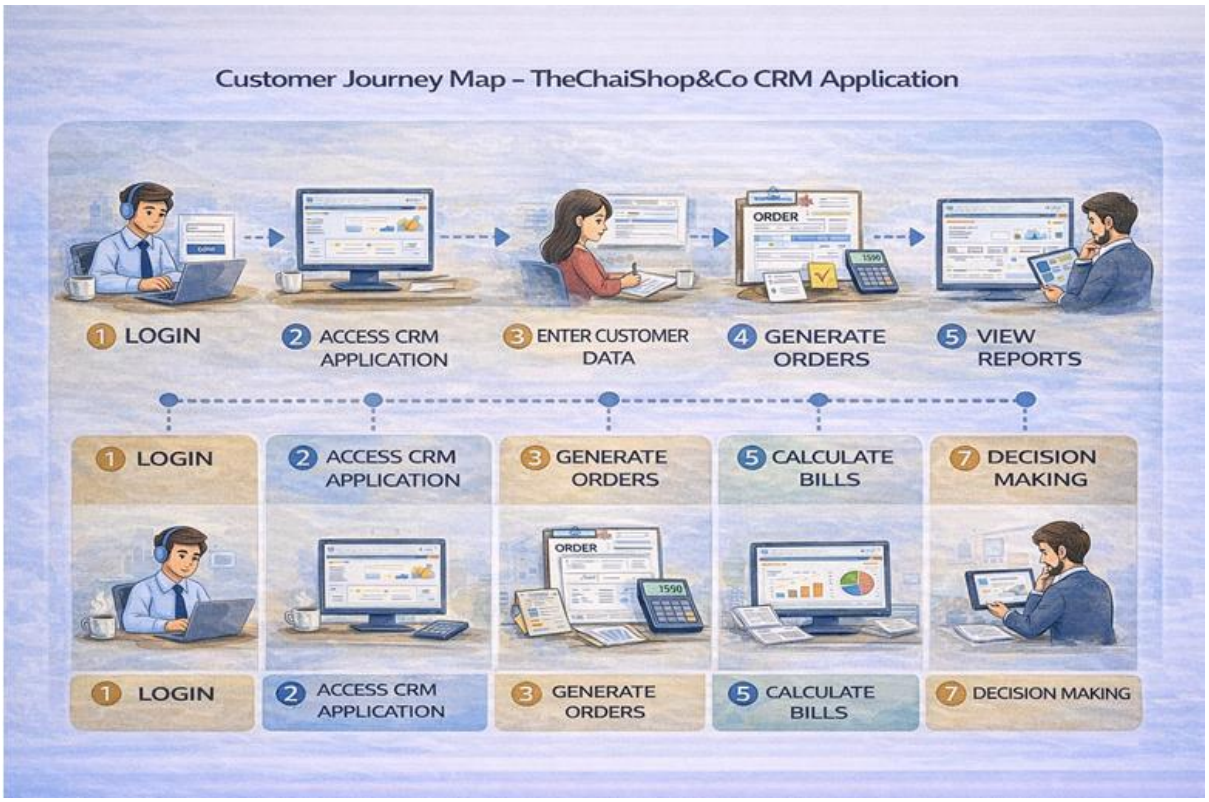
3.REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

Journey Stages:

- Login
- Access CRM Application
- Enter Customer Data
- Generate Orders
- Calculate Bills

- View Reports
- Decision Making



3.2 Solution Requirements

Functional Requirements

FR No	Requirement
FR-1	User Login
FR-2	Object Creation
FR-3	Data Entry
FR-4	Billing Automation
FR-5	Report Generation
FR-6	Email Automation

Non-Functional Requirements

NFR-1: Usability

The system should be easy to use for sales representatives, managers, administrators, and analysts without requiring technical training.

Requirements :

- *Simple and intuitive user interface*
- *Clear navigation menus*
- *Easy-to-understand forms*
- *User-friendly dashboards*

Example:

A new sales employee should be able to log in, enter customer details, and generate orders within a few minutes without help.

Salesforce Lightning UI provides drag-and-drop features and easy navigation.

NFR-2: Security

The system must protect customer and business data from unauthorized access.

Requirements:

- Role-based access control
- Secure login authentication
- Encrypted data storage
- Data backup and recovery

Examples:

- Profiles and permission sets
- Object-level and field-level security
- Restricted billing access
- Secure login and password policies

NFR-3: Reliability

The CRM system should work correctly at all times and store data accurately without loss.

Requirements:

- Automatic data saving
- Regular system backups
- Error handling mechanisms
- Stable cloud environment

Example :

If a user enters order data and the internet disconnects, the system should save the information and restore it later.

Salesforce cloud ensures automatic backups.

NFR-4: Performance

The system should respond quickly and handle large amounts of data efficiently.

Requirements:

- Fast page loading
- Quick report generation
- Smooth dashboard rendering
- Minimal delay

Example: When a manager generates monthly sales reports for hundreds of customers, the report should load within 2–3 seconds.

Optimized queries and caching improve speed.

NFR-5: Availability

The system should be accessible whenever required.

Requirements:

- 24/7 system availability
- Minimal downtime

- Cloud-based hosting
- Disaster recovery

Example: Managers should be able to access the CRM system during peak business hours, weekends, or late nights.

Salesforce cloud provides high uptime.

NFR-6: Scalability

The system should support business growth without affecting performance.

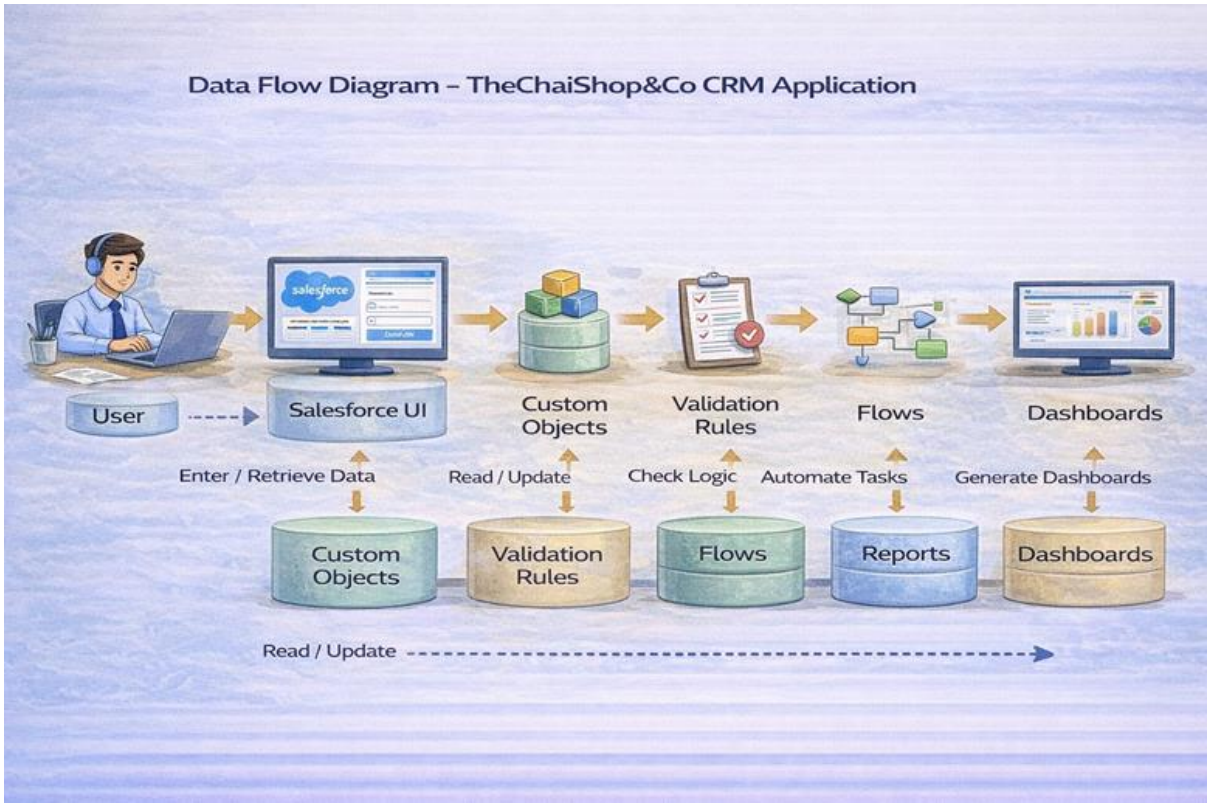
Requirements:

- Ability to handle more users
- Support increasing customer data
- Expandable storage
- Maintain system speed

Example: If TheChaiShop&Co expands to multiple branches, the CRM system should support thousands of customers without slowing down. Salesforce infrastructure automatically scales.

3.3 Data Flow Diagram

User → Salesforce UI → Custom Objects → Validation Rules → Flows → Reports → Dashboards.



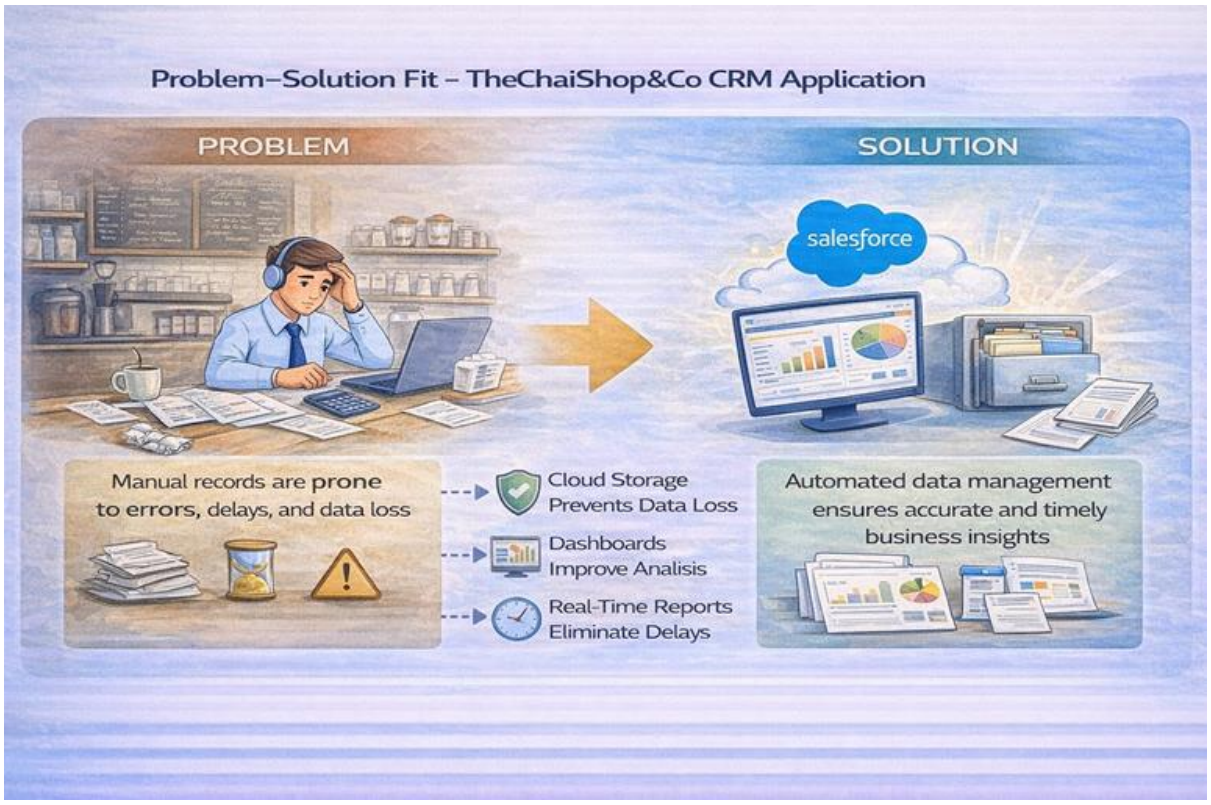
3.4 Technology Stack

Layer	Technology
Frontend	Salesforce Lightning
Database	Salesforce Cloud
Automation	Flows
Backend	Salesforce Platform
Analytics	Reports & Dashboards

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

The CRM system replaces manual records with automated data management. Cloud storage prevents data loss, dashboards improve analysis, and real-time reports eliminate delays. This ensures accurate and timely business insights generation.



4.2 Proposed Solution

Functional Requirements

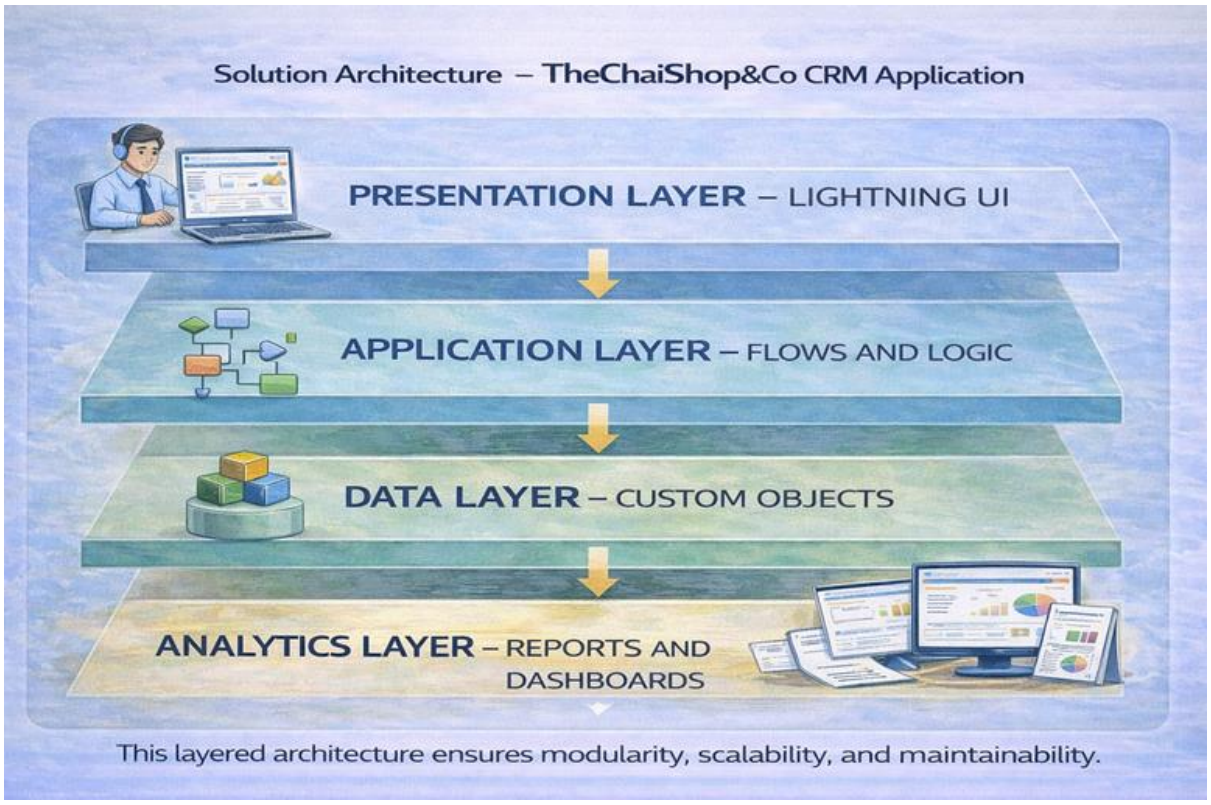
Parameter	Description
User Login & Authentication	Allows authorized users to securely log in to the CRM system using valid credentials.
Customer Record Management	Enables users to create, view, update, and delete customer details such as name, contact number, and address.
Employer & Enterprise Management	Allows management of employer and enterprise account information for business operations.
Order Management	Supports creation and tracking of customer orders, including order quantity and product details.
Automated Billing System	Automatically calculates total bill amount using formula fields based on order quantity and pricing.
Validation Rules	Ensures accurate data entry by validating fields such as phone number, PAN, and Aadhaar.
Record Types & Page Layouts	Provides different record types and layouts for various customer and enterprise categories.
Global Picklists	Maintains standardized values for fields such as product type, category, and status.
Email Notification System	Sends automated emails to customers for birthdays, offers, and order confirmations.
Workflow & Flow Automation	Automates tasks such as updating records and triggering alerts using Salesforce Flows.
Report Generation	Generates detailed reports on sales, customers, and enterprise performance.
Dashboard Visualization	Displays real-time analytics through interactive dashboards and charts.
Data Backup & Recovery	Ensures secure storage and recovery of business data in the Salesforce cloud.
User Role Management	Controls system access using profiles and permission sets for different users.

4.3 Solution Architecture

Architecture Layers

1. Presentation Layer – Lightning UI
2. Application Layer – Flows and Logic
3. Data Layer – Custom Objects
4. Analytics Layer – Reports and Dashboards

This layered architecture ensures modularity, scalability, and maintainability.



5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

● The project followed an Agile-based development approach with defined milestones and sprints.

● A Salesforce Developer account was created to set up the development environment.

● Custom objects were designed to store customer, employer, and enterprise data.

● Custom tabs and a Lightning Application were developed for easy system navigation.

● Fields, relationships, and global picklists were configured to ensure data consistency.

● Page layouts and record types were created based on user roles and customer categories.

● Validation rules were implemented to prevent incorrect data entry.

● Email templates and automated flows were developed for customer notifications.

● Reports and dashboards were created for performance monitoring and analysis.

● Regular sprint reviews and testing were conducted to track progress and resolve issues.

● The project was completed within the planned timeline through systematic

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

Use the below template to create product backlog and sprint schedule

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Member
Sprint-1	Developer Setup	USN-1	As an admin, I want to create a Salesforce developer account so TheChaiShop&Co CRM application	1	High	Member 1
Sprint-1	Data Modeling	USN-2	As an admin, I want to create Customer, Employer, and Enterprise objects so that business data can be stored and managed systamatically	3	High	Member 2
Sprint-2	Data Modeling	USN-3	As a user, I want separate tabs for each object so	3	High	Member 3

			that I can easily navigate and manage CRM			

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-2	Data Modeling	USN-4	As a manager, I want a dedicated Lightning App so that all CRM operations are accessible from a single dashboard.	3	High	Member 4
Sprint-2	Data Modeling	USN-5	As an admin, I want to create customer and order fields so that complete sales and billing details can be captured.	5	Medium	Member 1
Sprint-2	Data Modeling	USN-6	As a user, I want customized page layouts for different record types so that only relevant information is displayed	5	High	Member 2
Sprint-2	Data Modeling	USN-7	As a manager, I want separate	5	High	Member 3

			record types for Retail and Enterprise customers so that different business categories			
Sprint-3	Automation	USN-8	As a system, I want to validate customer details and order inputs so that incorrect data	3	High	Member 4
Sprint-3	Automation	USN-9	As a system, I want automated flows to send email notifications so that customers receive timely updates and offers.	5	High	Member 1
Sprint-4	Automation	USN-10	As a system, I want to automatically calculate billing amounts so that invoices are generated without manual effort.	5	High	Member 2
Sprint-5	Reports	USN-11	As a manager, I want sales and customer	4	High	Member 3

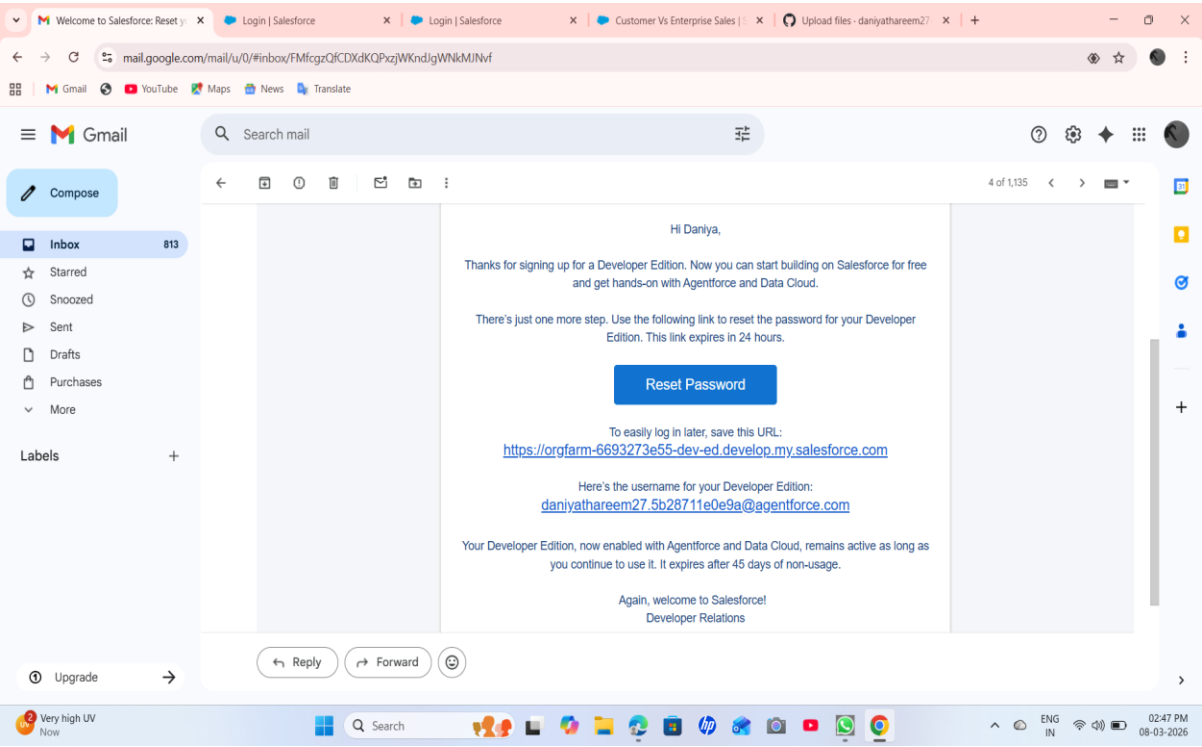
			reports so that I can monitor business performance and make informed decisions.			
Sprint-6	Dashboards	USN-12	As a manager, I want visual dashboards so that I can quickly analyze sales, customers, and enterprise performance.	4	High	Member 4

Project Tracker, Velocity & Burndown Chart: (4 Marks)

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-1	20	6 Days	24 Oct 2022	05 Nov 2022		
Sprint-1	20	6 Days	24 Oct 2022	12 Nov 2022		
Sprint-1	20	6 Days	24 Oct 2022	19 Nov 2022		

6. Project Development Phase:

Milestone 1:



1. The screenshot shows the confirmation email received after successfully registering for a **Developer Edition account** on the Salesforce platform.

2. After completing the registration form on the official website, the system sends an automated email to verify and activate the newly created account.

3. The email begins with a welcome message titled **"Welcome to your Developer Edition"**, confirming that the account has been created successfully.

4. The message contains the user's name and acknowledges that the user has signed up for a free developer environment to build and test applications.

5. The email explains that the user can start developing applications using the Salesforce platform and explore features such as **Agentforce** and **Data Cloud**.

6. To complete the account setup, the user must click the **Reset Password** button provided in the email.

7. This password reset link is used to create a secure password for accessing the developer account.

8. The email also mentions that the activation link will expire within **24 hours**, ensuring security during the account setup process.

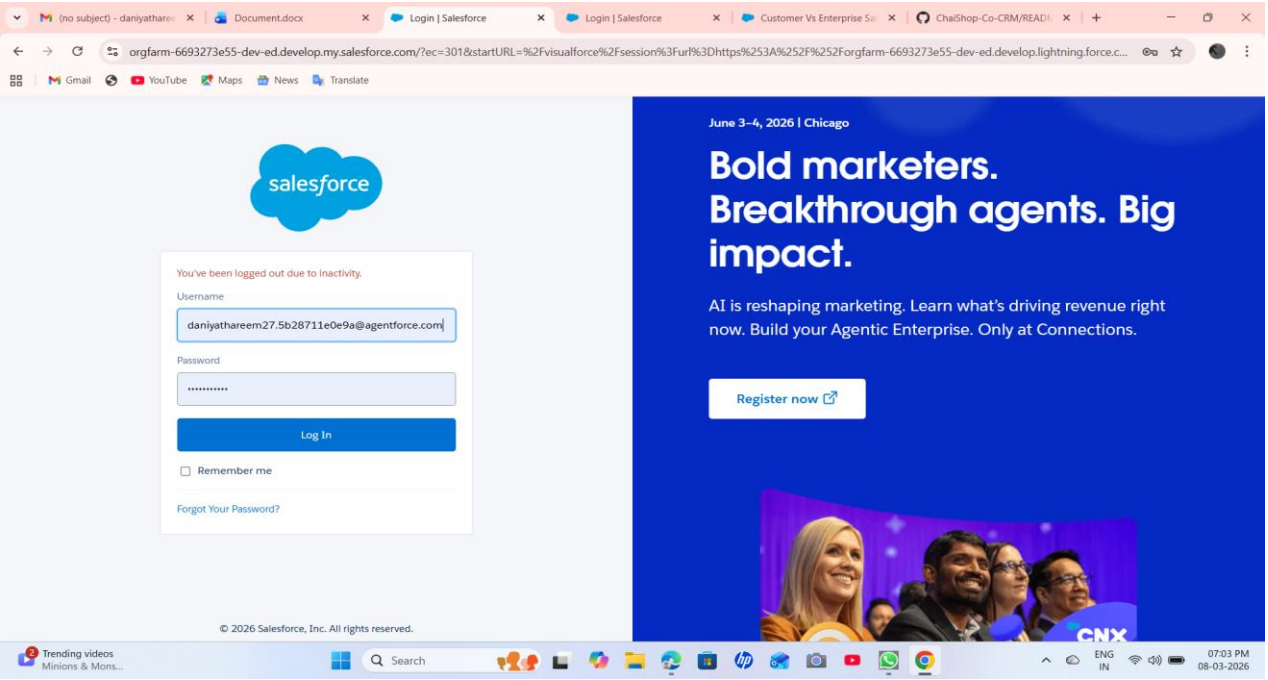
9. A unique login URL is provided so that the user can easily access the Salesforce developer environment in the future.

10. The message also displays the **username assigned to the developer account**, which is required during login.

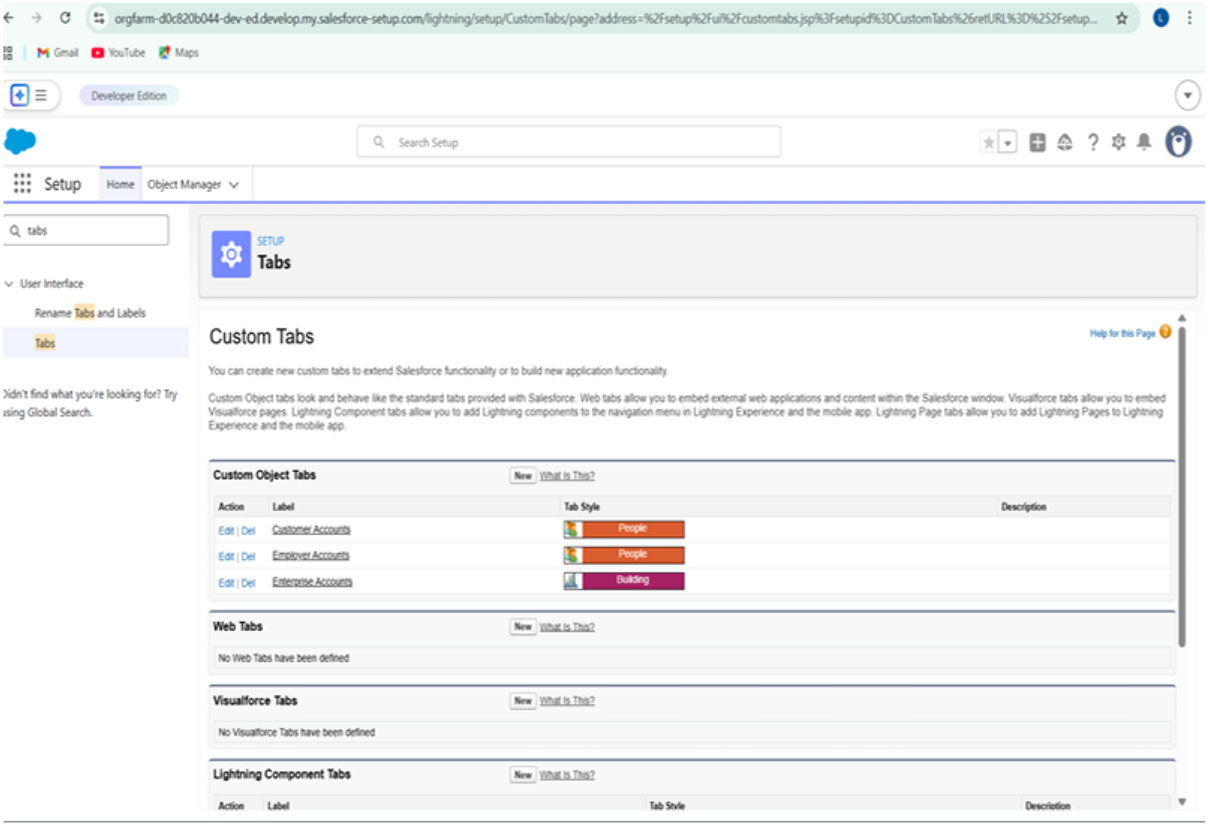
11. Once the password is successfully created, the user can log in to the Salesforce dashboard and begin configuring the CRM application.

12. This step confirms that the developer environment has been successfully created and is ready to be used for building and managing the CRM project.

Milestone 2



Milestone 3



1. The Salesforce Setup page being viewed is the Custom Tabs configuration section.

2. The user is logged into a Salesforce Developer Edition environment.

3. A search for “tabs” has been performed in the Setup search bar.

4. The page displays several categories of tabs: Custom Object Tabs, Web Tabs, Visualforce Tabs, and Lightning Component Tabs.

5. Under Custom Object Tabs, three custom tabs are listed.

6. The three custom object tabs are: Customer Accounts, Employee Accounts, and Enterprise Accounts.

7. Each of the three tabs has an Edit option available.

8. Each custom tab is assigned a Tab Style, represented visually with icons: People (two variations) and Building.

9. None of the listed custom object tabs include descriptions.

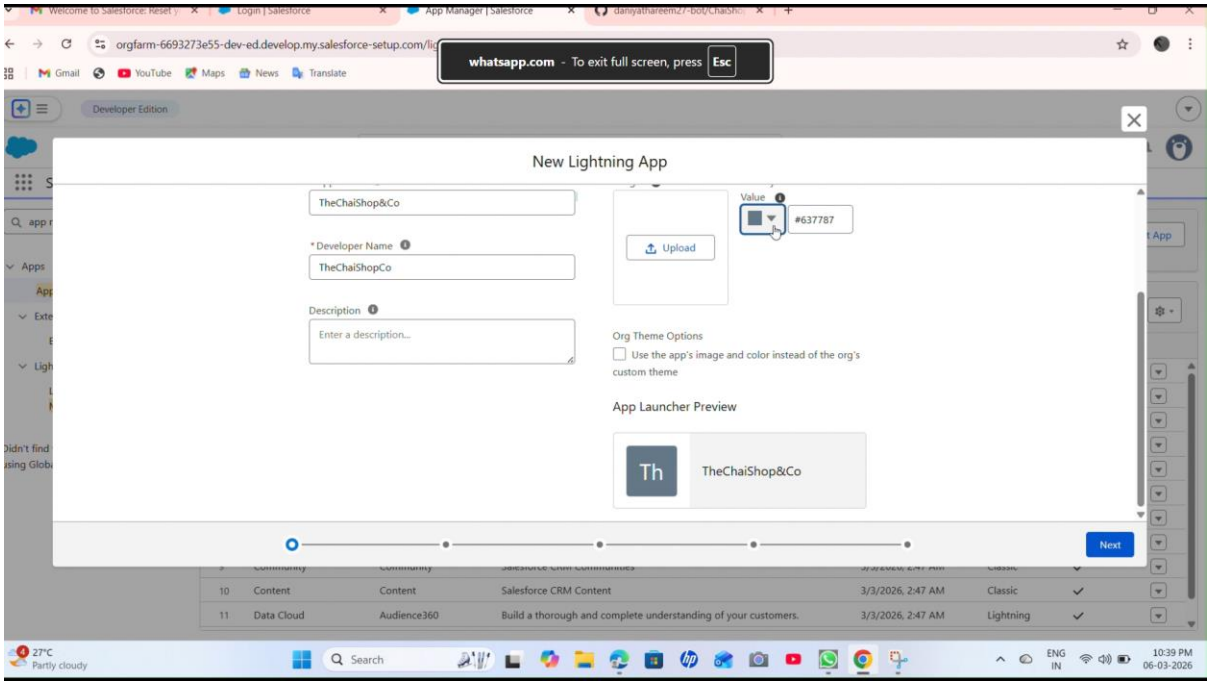
10. The Web Tabs section shows no existing web tabs.

11. The Visualforce Tabs section also shows no Visualforce tabs defined.

12. The Lightning Component Tabs section appears at the bottom but no tabs have been created there either.

13. A Help for this Page link is visible on the right side of the page for guidance on managing custom tabs.

Milestone 4:



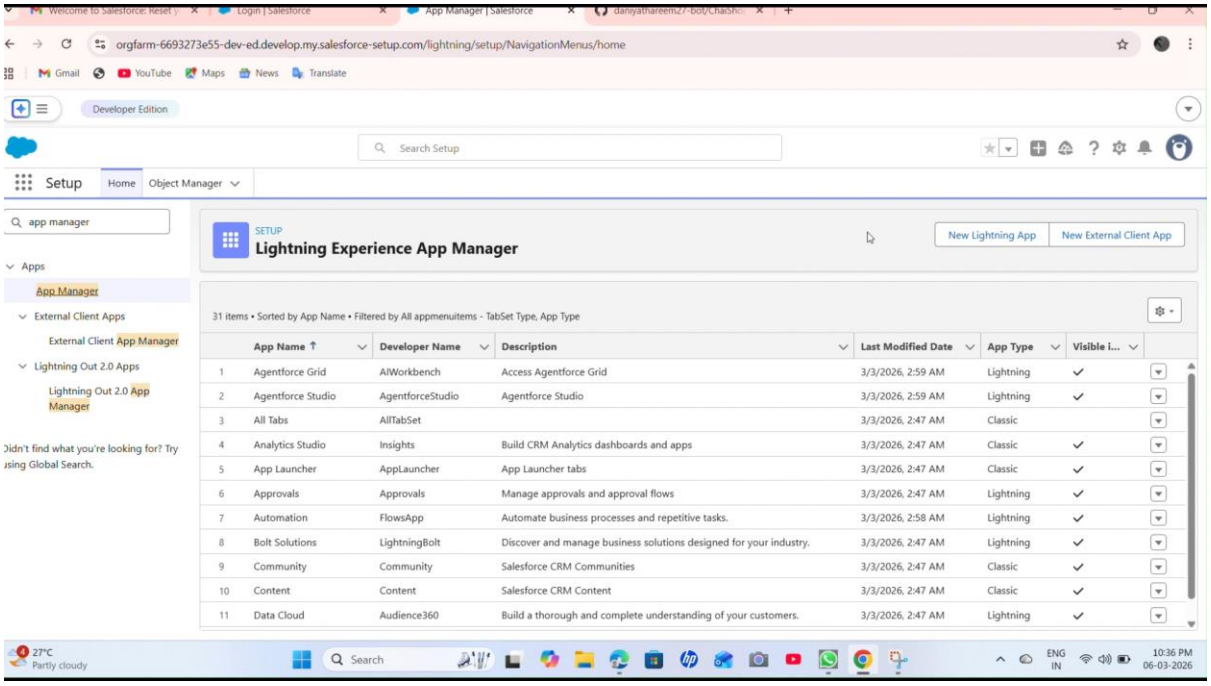
1. The screen displays a “New Lightning App” setup dialog.
2. It belongs to the Salesforce Lightning Experience application builder environment.
3. The App Details section is visible on the left side.
4. The App Name field is filled with “TheChaiShop&Co”.
5. The Developer Name field also shows “TheChaiShop&Co”.
6. A Description field is available to enter details about the app.
7. On the right side, there is an App Branding section.
8. The branding section allows users to upload an image/logo for the app.
9. A Primary Color Value is shown as #0070D2.
10. There is an option to use the app’s image and color instead of the organization’s custom theme.

11. The interface includes an App Launcher Preview showing how the app icon will appear.

12. The preview icon displays the letters “Th” representing the app.

13. A Next button is present at the bottom right to continue the app creation process.

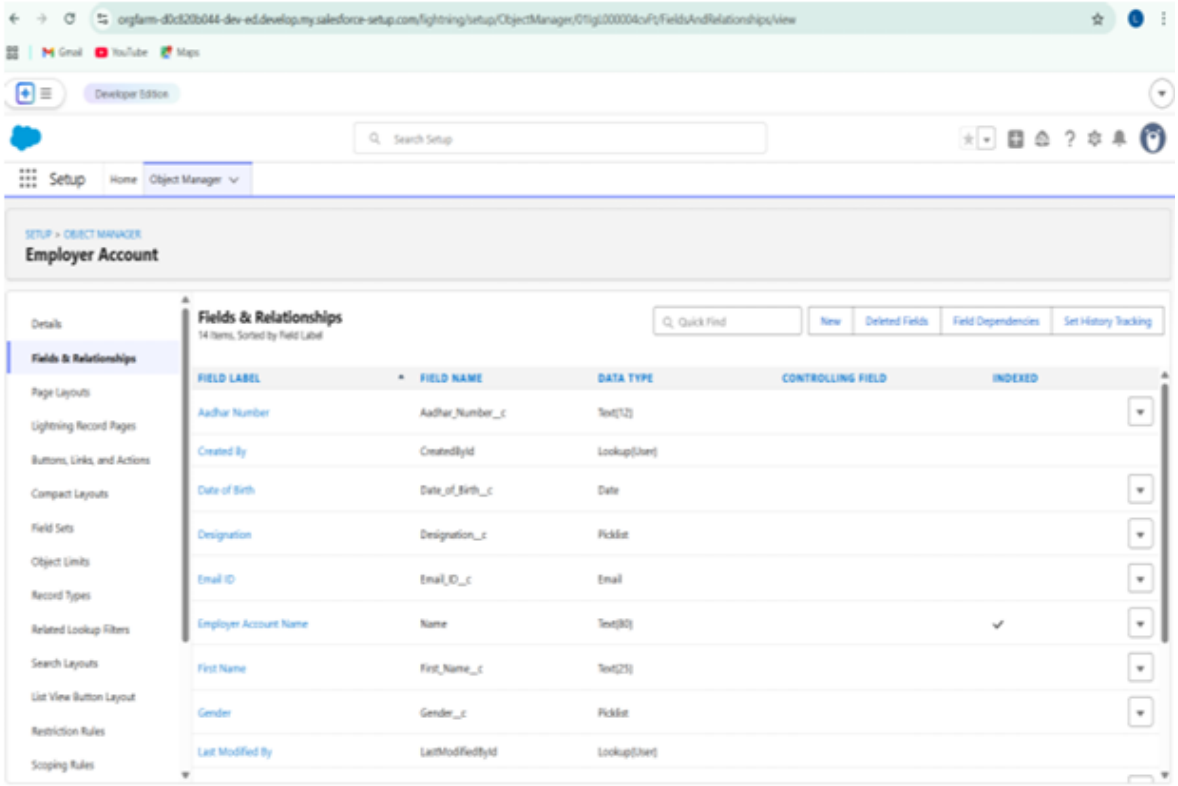
business application such as a Chai Shop CRM system.



1. The system uses **Salesforce Developer Edition as the CRM development environment.
2. The configuration is performed inside the **Salesforce Lightning Experience Setup panel.
3. The Lightning Experience App Manager is used to create, modify, and manage applications within the platform.
4. The App Manager displays all available applications in a structured tabular format.
5. Each application in the list contains attributes such as App Name, Developer Name, Description, Last Modified Date, App Type, and Visibility.
6. The interface allows administrators to create a new application using the New Lightning App button.
7. The system also supports integration with external systems through the New External Client App option.
8. Applications can be categorized as Lightning Apps or Classic Apps, depending on the interface they support.
9. The Developer Name field uniquely identifies the app internally in the system.
10. The Description column helps document the purpose and functionality of each application.
11. The Last Modified Date provides audit information regarding recent configuration changes.
12. The Visible column indicates whether the application is accessible to users.
13. The dropdown action menu on the right side of each app provides administrative actions such as edit, clone, or delete.

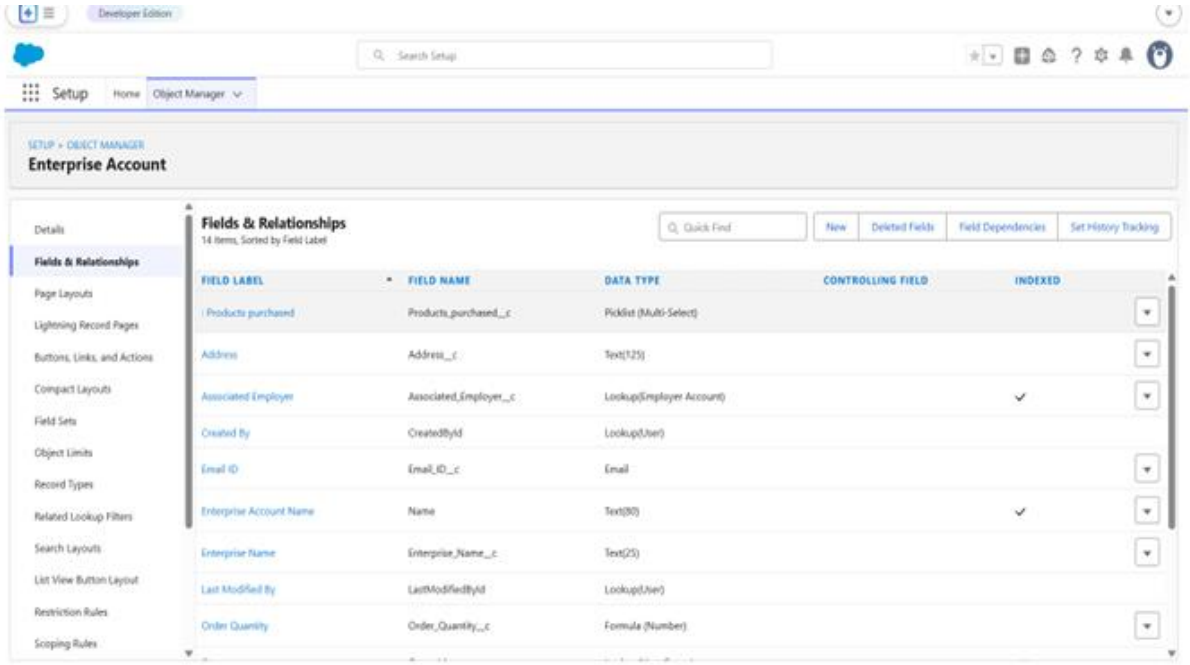
14. The App Manager allows administrators to control which apps appear in the App Launcher for end users.
15. The interface supports efficient application management for CRM modules like Analytics, Automation, Approvals, and Data Management

Milestone 5:



1. The configuration is performed in the Object Manager module of Salesforce.
2. A custom object named Employer Account is used to store employer-related information in the system.
3. The Fields & Relationships section is used to create and manage data fields within the object.
4. Each field contains attributes such as Field Label, Field Name, Data Type, and Indexed status.
5. Custom fields are identified with the suffix "__c", indicating they were created by developers.
6. The Aadhar Number field is created using the Text data type to store identification numbers.
7. The Date of Birth field uses the Date data type to record the employer's birth details.
8. The Designation field is implemented using a Picklist data type to allow selection from predefined roles.

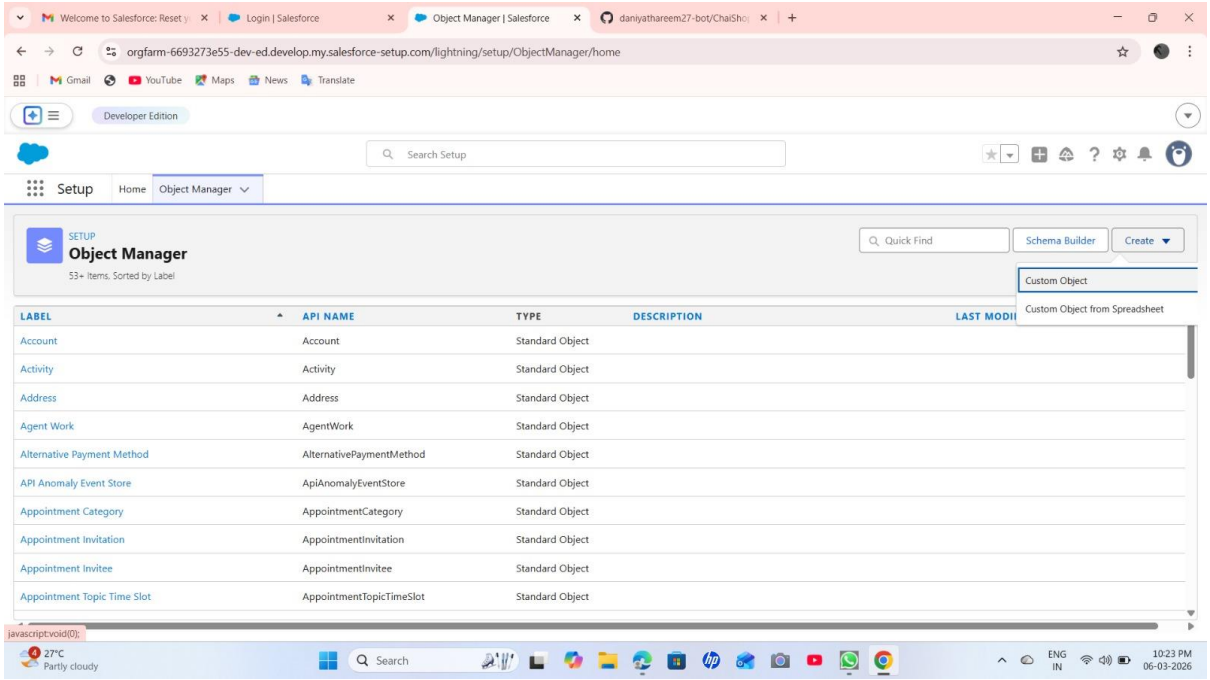
9. The Email ID field uses the Email data type to store valid email addresses.
10. The Employer Account Name field acts as the primary identifier for the record.
11. The First Name field is created using the Text data type to capture the employer's first name.
12. The Gender field is implemented as a Picklist to provide selectable gender options.
13. System-generated fields such as Created By and Last Modified By use Lookup(User) relationships.
14. The Quick Find search bar helps administrators quickly locate specific fields.
15. The interface also provides options such as New Field, Deleted Fields, Field Dependencies, and Set History Tracking for managing field configurations.



1. The system is developed using the Salesforce CRM platform.
2. The configuration is performed in the Salesforce Lightning Experience Setup environment.
3. The Object Manager is used to manage standard and custom objects within the application.
4. A custom object named Enterprise Account is created to store enterprise-level customer information.
5. The Fields & Relationships section is used to define and manage fields within the object.
6. Each field consists of attributes such as Field Label, Field Name, Data Type, Controlling Field, and Indexed status.
7. Custom fields are identified with the suffix "__c", which indicates developer-created fields.

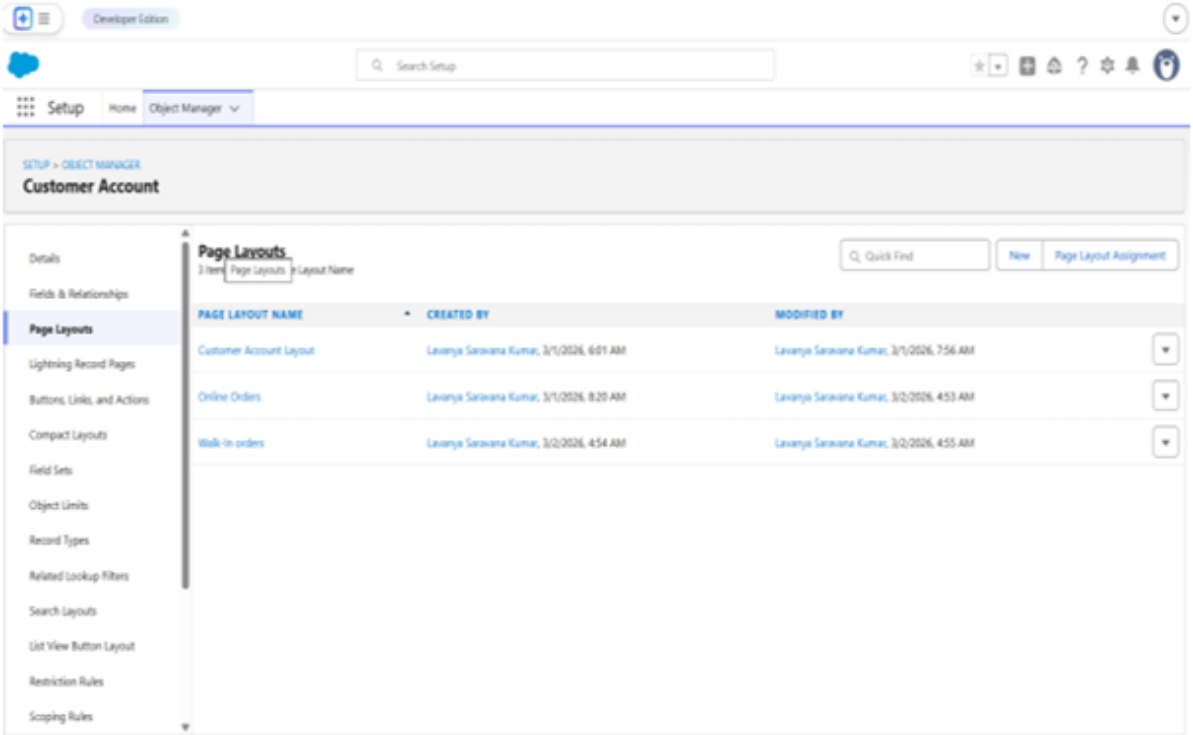
8. The Enterprise Account Name field acts as the primary record identifier.
9. The Enterprise Name field is created using the Text data type to store enterprise names.
10. The Address field is implemented using the Text data type with a character limit.
11. The Email ID field uses the Email data type to store valid email addresses.
12. The Products Purchased field is implemented as a Multi-Select Picklist.
13. The Multi-Select Picklist allows users to select multiple products purchased by the enterprise.
14. The Associated Employer field uses a Lookup relationship to connect Enterprise Account with Employer Account.
15. Lookup relationships help maintain data relationships between objects.
16. The Created By field is a system-generated field that stores the user who created the record.
17. The Created By field uses the Lookup(User) relationship.
18. The Last Modified By field tracks the user who last updated the record.
19. The Last Modified By field also uses the Lookup(User) data type.
20. The Order Quantity field is created using a Formula (Number) data type.
21. Formula fields automatically calculate values based on predefined expressions.
22. Indexed fields help improve search and query performance.
23. The Quick Find search bar allows administrators to quickly locate specific fields.
24. Administrators can create new fields using the New button in the Fields & Relationships section.
25. The Deleted Fields option allows recovery of recently deleted custom fields.
26. The Field Dependencies feature allows one field to control the values of another field.
27. The Set History Tracking option enables tracking of field value changes.
28. The left navigation panel includes configuration options such as Page Layouts, Record Types, and Field Sets.
29. Page Layouts allow administrators to control how fields appear on record pages.
30. This configuration helps organize enterprise customer data efficiently and supports better CRM data management

Milestone 8:



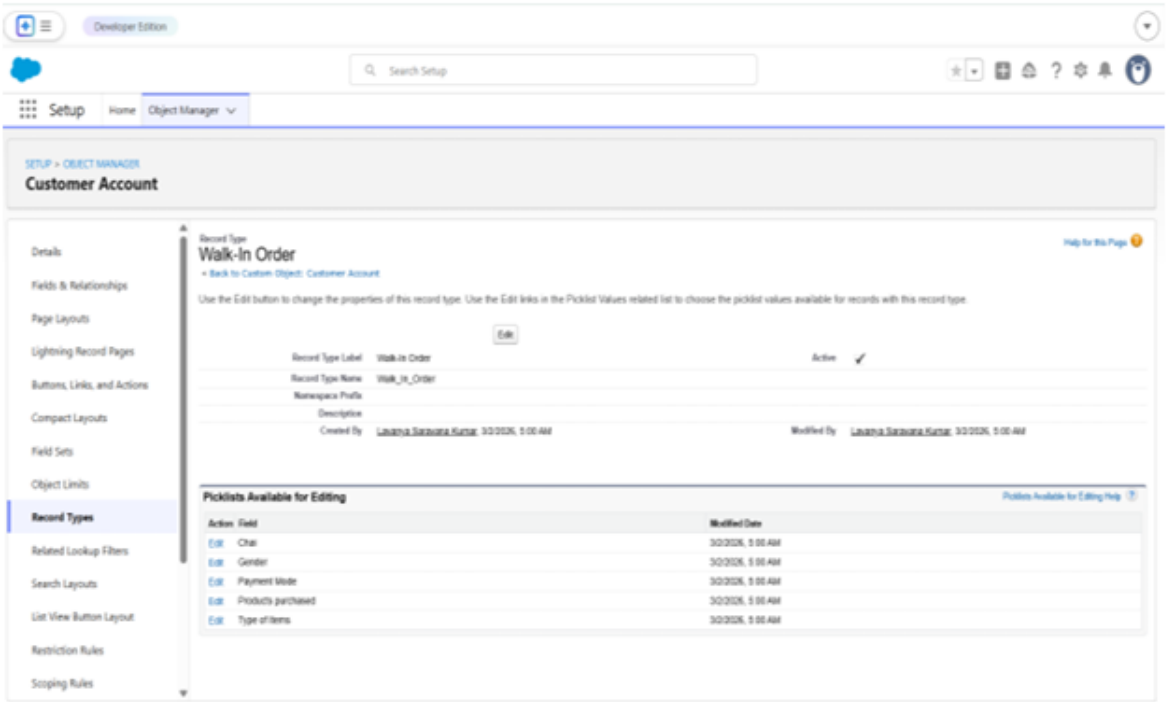
1. The application is developed using the Salesforce Customer Relationship Management (CRM) platform.
2. The configuration is performed in the Salesforce Lightning Experience Setup environment.
3. The Object Manager module is used to create, manage, and customize objects in the system.
4. Objects in Salesforce represent database tables used to store business data.
5. The Object Manager displays objects in a tabular format with columns such as Label, API Name, Type, Description, Last Modified, and Deployed Status.
6. Objects can be categorized as Standard Objects or Custom Objects.
7. Standard objects are pre-built objects provided by Salesforce.
8. Custom objects are created by developers to meet specific business requirements.
9. The Enterprise Account object is a custom object created for storing enterprise-related information.
10. The Customer Account object is another custom object used to maintain customer data.
11. The Employer Account object is designed to store employer-related records.
12. Custom objects have API names ending with "__c", which identifies them as custom entities.
13. The API Name is used for system integration and programmatic access.
14. The Type column indicates whether the object is standard or custom.
15. The Description column allows administrators to document the purpose of each object.

16. The Last Modified column shows the date when the object configuration was last updated.
17. The Deployed status indicates whether the object is active and available to users.
18. The Quick Find search bar helps administrators locate specific objects quickly.
19. The Create button allows users to create new custom objects.
20. The Schema Builder option provides a visual representation of object relationships.
21. Schema Builder helps in designing data models and object relationships visually.
22. Objects can contain fields, relationships, validation rules, and page layouts.
23. Each object stores records that represent real-world business entities.
24. Custom objects support relationships such as Lookup and Master-Detail.
25. The Object Manager also allows administrators to manage record types and page layouts.
26. Administrators can define field-level security and permissions for objects.
27. Object configuration plays an important role in data organization and management.
28. The object structure forms the foundation of the Salesforce data model.
29. Proper object design helps improve data consistency and application performance.
30. The Object Manager simplifies administration by providing a centralized interface for managing all objects in the system.



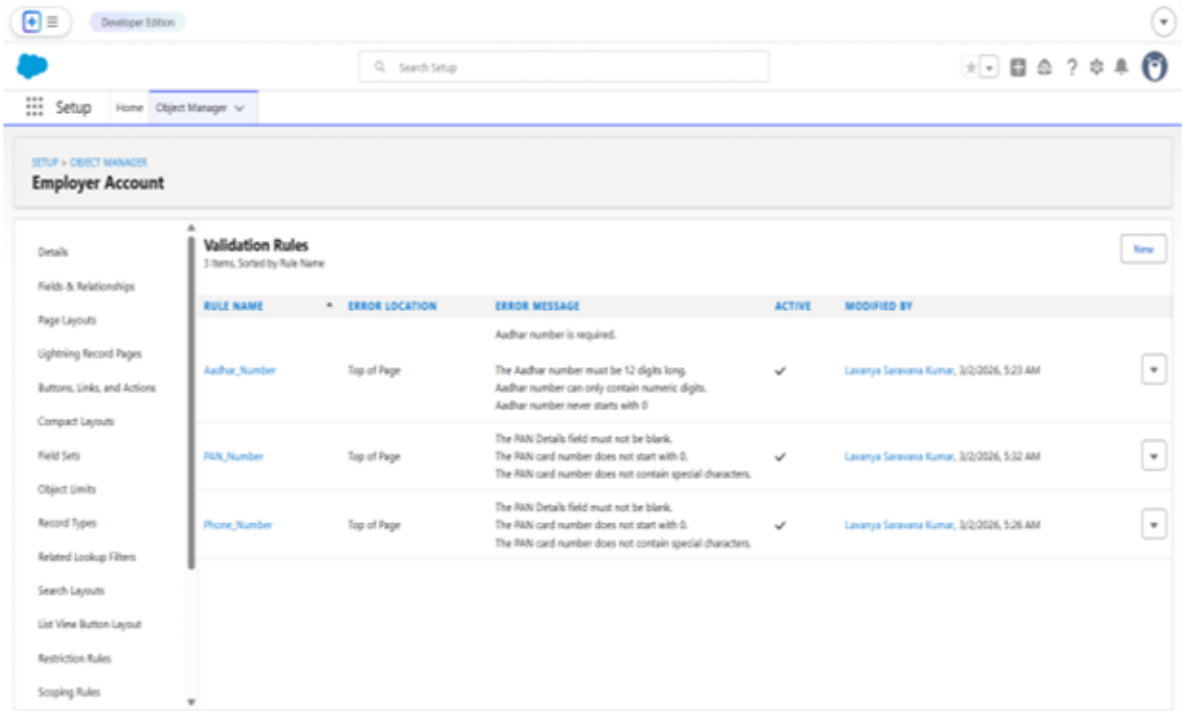
1. The screenshot shows the Page Layouts section for the Customer Account object in Salesforce.
2. The navigation path visible is Setup → Object Manager → Customer Account → Page Layouts.
3. Page Layouts control how fields, buttons, and related lists appear on a record page.
4. This section allows administrators to design the user interface for records of the Customer Account object. 28
5. The page shows a list of 3 page layouts available for this object.
6. Each page layout can be assigned to different profiles or record types.
7. The table includes columns such as Page Layout Name, Created By, and Modified By.
8. Page Layout Name shows the name of each layout used for displaying record details.
9. Created By shows the user who created the layout along with the date and time.
10. Modified By shows who last edited the layout and when it was modified.
11. The first layout listed is Customer Account Layout, which is likely the default layout for the object.
12. The second layout is Online Orders, which may be used for customers placing orders online.
13. The third layout is Walk-In Orders, which may be used for customers placing orders directly in person.
14. These multiple layouts allow the system to show different field arrangements based on business scenarios.
15. The Quick Find search box helps users quickly locate a specific page layout.
16. The New button allows administrators to create a new page layout.

17. The Page Layout Assignment button is used to assign layouts to profiles and record types.
18. Clicking a layout name opens the layout editor, where fields and sections can be arranged.
19. In the layout editor, administrators can drag and drop fields, buttons, and related lists.
20. The left sidebar shows other configuration options such as Fields & Relationships, Lightning Record Pages, Buttons, Links and Actions, and Compact Layouts.
21. Lightning Record Pages allow advanced UI customization using the Lightning App Builder.
22. Buttons, Links, and Actions allow adding custom actions to the record page.
23. Compact Layouts define the key fields displayed in the highlights panel of a record.
24. Field Sets allow grouping fields that can be reused in Visualforce pages or other custom interfaces.
25. Overall, the Page Layouts section helps administrators control how users view and interact with Customer Account records in Salesforce. 2



1. The configuration is performed in the Object Manager module of Salesforce.
2. The Customer Account object is used to manage customer-related information in the system.

3. A Record Type named “Walk-In Order” is created to categorize a specific type of customer order.
4. Record Types help differentiate business processes and data entry requirements within the same object.
5. The Record Type Label displayed is Walk-In Order, which represents orders placed directly by customers.
6. The Record Type Name (API Name) is Walk_In_Order, used for system-level identification.
7. The Record Type is marked as Active, allowing users to create records using this category.
8. The configuration allows administrators to control picklist values based on the record type.
9. Picklist fields associated with this record type include City, Gender, Payment Mode, Products Purchased, and Type of Items.
10. The Picklists Available for Editing section allows administrators to modify available picklist values for the selected record type.
11. The record type configuration helps ensure better data organization and supports different customer order processes within the CRM system.



1) You are inside Setup → Object Manager → Employer Account → Validation Rules in **Salesforce.

2) Validation Rules are used to control data quality by checking conditions before a record is saved. If the condition fails, an error message is shown and the record cannot be saved.

3) In this object, there are 3 validation rules created to validate important fields:

a. Aadhar Number

b. PAN Number

c. Phone Number

4) The Rule Name column shows the name of each validation rule:

a. Aadhar_Number

b. PAN_Number

c. Phone_Number

5) The Error Location for all rules is Top of Page, which means the error message will appear at the top of the record page when the validation fails. 6) The Aadhar_Number validation rule checks the Aadhaar field with these conditions:

a. The Aadhaar number must be provided (cannot be blank).

b. The Aadhaar number must contain exactly 12 digits.

c. The Aadhaar number can only contain numeric digits.

d. The Aadhaar number cannot start with 0.

7) The PAN_Number validation rule ensures proper PAN details:

a. The PAN field cannot be blank.

b. The PAN number cannot start with 0.

c. The PAN number cannot contain special characters.

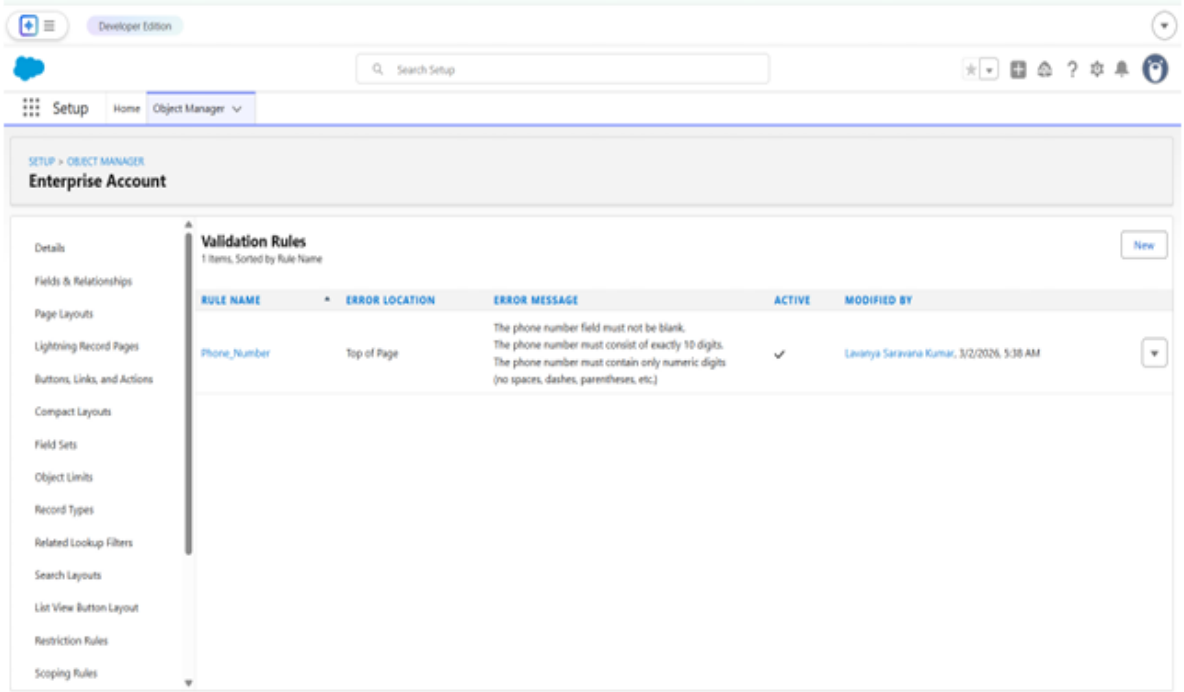
8) The Phone_Number validation rule is also active and checks the phone number field to ensure valid formatting. (The error message appears similar to the PAN rule in the screenshot, which may indicate it was copied or needs adjustment.)

9) The Active column shows a checkmark for all three rules, meaning all validation rules are currently enabled.

10) The Modified By column shows the user who last edited the rule, which is **Nafiya along with the date and time of modification.

11) The New button on the right side allows administrators to create additional validation rules for this object.

12) These rules help ensure that only valid Aadhaar, PAN, and Phone data are stored in the Employer Account records, improving data accuracy and preventing incorrect entries.



1. The configuration is performed in the Object Manager module of Salesforce.

2. The Enterprise Account object is used to store enterprise-related customer information in the system.

3. The Validation Rules section is used to enforce data integrity and ensure correct data entry

4. A validation rule named Phone_Number is created for validating phone number input.

5. Validation rules automatically check field values before a record is saved.

6. The Error Location for this rule is set to Top of Page, meaning the error message appears at the top of the record page.

7. The rule ensures that the phone number field must not be blank.

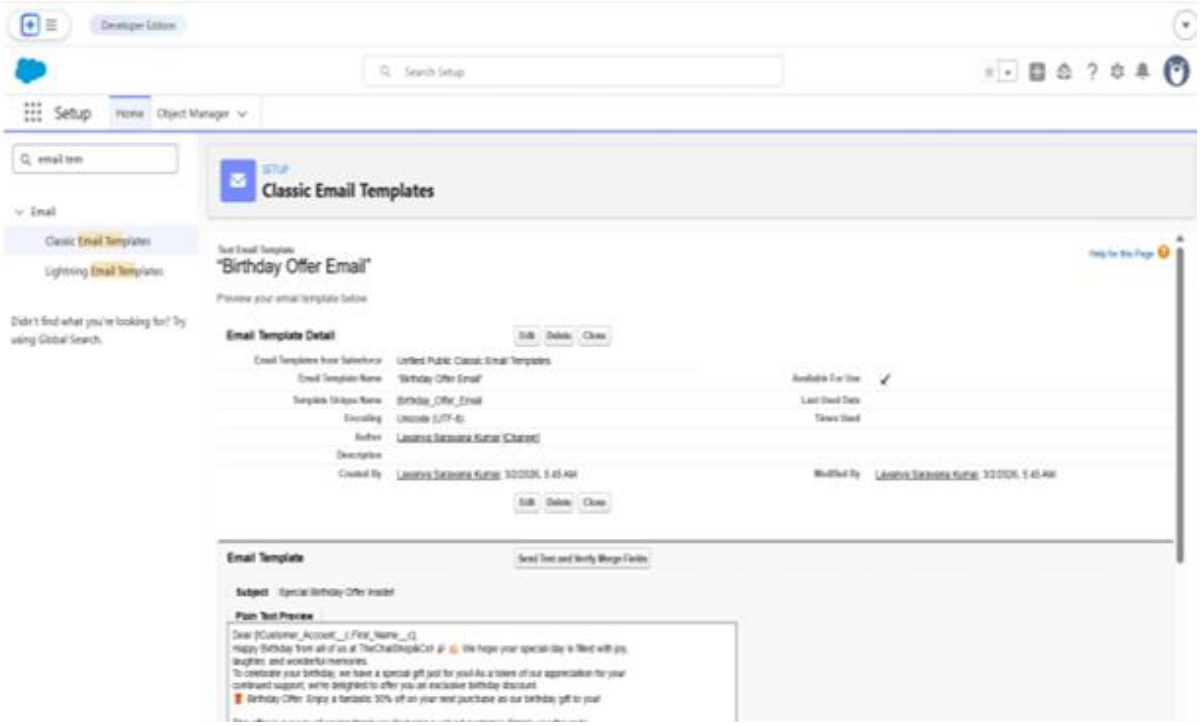
8. The validation rule requires the phone number to contain exactly 10 digits.

9. The rule also ensures that only numeric digits are allowed, preventing characters such as spaces, dashes, or parentheses.

10. The validation rule is active, which means it is currently enforced when users enter or update records.

11. The Modified By column records the user and timestamp of the last modification made to the validation rule.

Milestone 9:



The screenshot shows the Classic Email Template configuration page in Salesforce for a template named “Birthday Offer Email.” Below is the explanation in continuous points:

1. You are in Setup → Email → Classic Email Templates in Salesforce, where administrators create and manage reusable email templates.

2. The selected template is called “Birthday Offer Email”, which is a Text Email Template used to send birthday wishes and promotional offers to customers.

3. The Email Template Detail section shows the main configuration information of the template.

4. The Email Template Name is Birthday Offer Email, which is the display name used to identify the template.

5. The Template Unique Name is Birthday_Offer_Email, which is the system-generated identifier used internally by Salesforce.

6. The Encoding is Unicode (UTF-8), allowing the email to support special characters and emojis.

7. The Author of the template is Nafiya, who created and manages the template.

8. The Created By and Modified By fields indicate that Nafiya created and last updated the template on March 5, 2026 at 4:55 AM. 34

9. The Available for Use checkbox is enabled, which means this template can be used in email alerts, workflows, or manual emails.

10. The Edit, Delete, and Clone buttons allow administrators to modify the template, remove it, or create a duplicate version.

11. The Email Template section shows the actual email content that will be sent to customers.

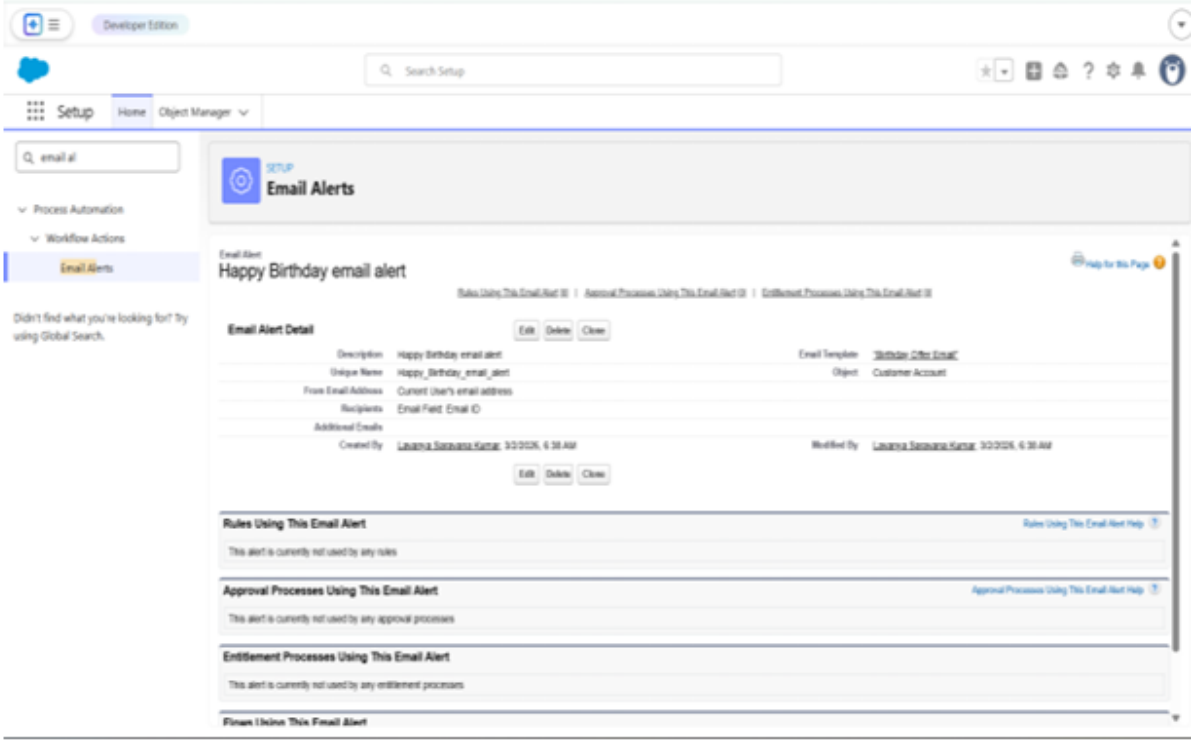
12. The Subject line is “Special Birthday Offer Inside!”, which appears in the recipient’s inbox.

13. The Plain Text Preview shows the message body that includes: ▯ A greeting to the customer using a merge field (for example, first name). ▯ A birthday wish message. ▯ A promotional birthday offer from the company. ▯ A 50% discount on the next purchase as a birthday gift.

14. The template uses merge fields such as Customer Account First Name, which automatically insert customer specific data when the email is sent.

15. The Send Test and Verify Merge Fields button allows the administrator to test the email and confirm that merge fields populate correctly.

16. This template helps automate personalized birthday emails, improving customer engagement and marketing



The screenshot shows the Email Alert configuration page in Salesforce for an alert named “Happy Birthday email alert.” Below is the explanation in continuous points:

1. You are in Setup → Process Automation → Workflow Actions → Email Alerts in Salesforce, where automated email notifications are configured.

2. The email alert created here is named “Happy Birthday email alert.” It is used to automatically send birthday greeting emails to customers.

3. The Email Alert Detail section shows the configuration details of this alert.

4. The Description is Happy Birthday email alert, which explains the purpose of this automation.

5. The Unique Name is Happy_Birthday_email_alert, which is the system identifier used internally in Salesforce.

6. The Email Template linked to this alert is “Birthday Offer Email.” This template contains the actual birthday message and promotional content sent to customers.

7. The Object associated with this alert is Customer Account, meaning the email will be triggered based on records from the Customer Account object.

8. The From Email Address is set to Current User's email address, meaning the email will appear as if it was sent by the user who triggered the automation.

9. The Recipients field is set to Email Field: Email ID, meaning the system will send the email to the email address stored in the Email ID field of the Customer Account record.

10. The Additional Emails section is currently empty, which means no extra email addresses are included in the notification.

11. The Created By and Modified By fields show that the email alert was created and last updated by Nafiya on March 5, 2026 at 5:30 AM.

12. The Edit, Delete, and Clone buttons allow administrators to modify the alert, remove it, or create a copy of it.

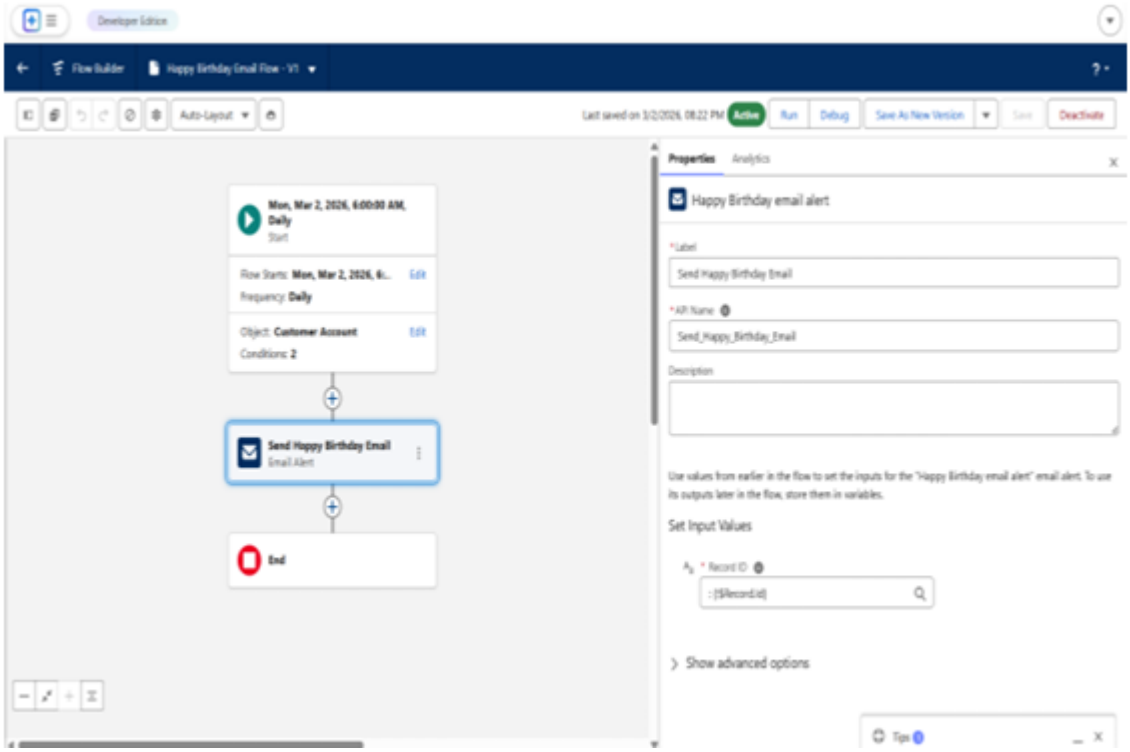
13. The Rules Using This Email Alert section shows that no workflow rules are currently using this email alert.

14. The Approval Processes Using This Email Alert section also indicates that no approval processes are using this alert.

15. The Entitlement Processes Using This Email Alert section shows that this alert is not currently linked to any entitlement processes.

16. This means the email alert is created and configured but has not yet been connected to any automation such as workflow rules or flows.

Milestone 10:



1. The flow is created in Salesforce Flow Builder and the flow name is “Happy Birthday Email Flow – V1.”

2. The flow type is a Scheduled Flow, which means it runs automatically at a specific time instead of being triggered by a user action.

3. The Start element is configured to run Daily at 6:00 AM starting from March 5, 2026.

4. The flow runs on the Customer Account object, meaning it will check records from this object every day.

5. There are 2 conditions defined in the start configuration. These conditions determine which Customer Account records should be processed by the flow (for example, checking if the birthday field equals today's date).

6. When the flow runs at 6:00 AM, it queries all Customer Account records that satisfy the defined conditions.

7. For each record that matches the conditions, the flow proceeds to the next element called “Send Happy Birthday Email.”

8. The Send Happy Birthday Email element is an Email Alert action.

9. This email alert uses the configured alert “Happy Birthday email alert.” It sends a predefined email template to the recipients defined in that alert.

10. In the Properties panel, the label of the element is Send Happy Birthday Email, and its API Name is Send_Happy_Birthday_Email.

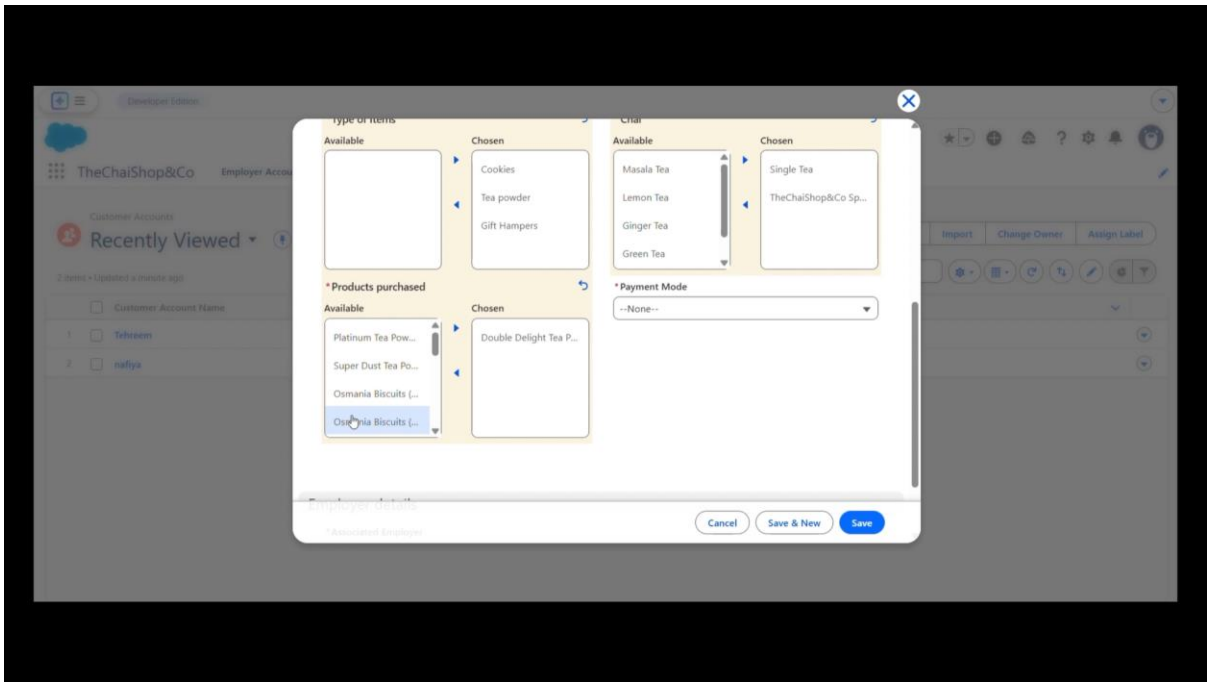
11. The flow passes the Record ID ($Record.Id) of the current Customer Account record to the Email Alert.

12. This Record ID helps the system identify which record triggered the email so that the email template can use fields from that specific record (like the customer's name or birthday).

13. Once the email is sent successfully, the flow moves to the End element, which terminates the execution for that record.

14. Because the flow runs daily, it will repeat this process every day and automatically send birthday emails to customers whose birthdays match the defined conditions.

Milestone 11:



This page is used to create a new record in the system, likely related to an Employer Account or Order record.

The first section displayed is Order Details, where the user specifies the items and products being ordered.

The field Type of Items is a multi-select picklist with two columns:

1. Available – shows the options that can be selected (example: Tea powder).

2. Chosen – shows the items already selected (Cookies, Gift Hampers).

a. The arrows between the lists allow the user to move items from Available to Chosen or remove them.

b. The field Products Purchased is another multi-select picklist used to select specific products included in the order.

c. In the Available column of this field, some products visible include:

3. Melting Moments

4. Honey Oats Cookies

5. Signature Box

6. Assorted Box

a. In the Chosen column, the products already selected for the order include:

7. Dry Fruit Biscuits

8. Fruit Biscuits

9. Multigrain Biscuits

10. Double Choco Chip (partially visible)

a. On the right side, the Payment Mode field is shown as a dropdown picklist.

b. The selected payment method is PhonePe, indicating that the customer will pay using this digital payment platform.

c. Below the Order Details section is Employer Details, which connects the order with an employer record.

d. The field Associated Employer is a lookup field, allowing the user to search and select an employer record.

e. The employer selected in the screenshot is Nafiya.

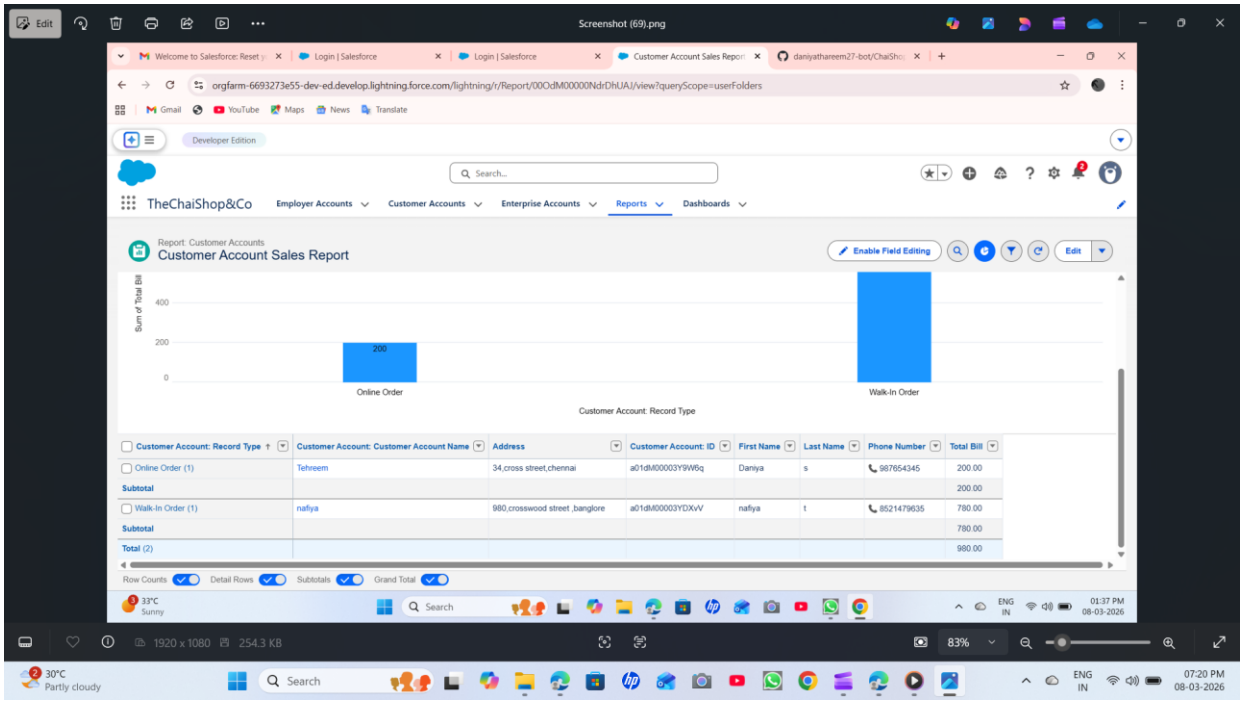
f. At the bottom of the form, there are three action buttons:

11. Cancel – closes the form without saving.

12. Save & New – saves the current record and opens a new blank form.

13. Save – saves the current record and closes the form.

a. Required fields are marked with a red asterisk (*), meaning the user must fill them before saving



1. The report name displayed at the top is Customer Account Sales Report and it is built using the Customer Accounts report type.

a. The report is opened in Report Builder, where users can design the report layout, add filters, group data, and visualize results.

b. At the top-right, there are report action buttons such as Save & Run, Save, Close, and Run, which allow users to save the configuration or execute the report.

c. On the left panel, the Outline section is visible. This section controls how the report data is structured.

d. In the Groups section, the rows are grouped by Customer Account: Record Type.

e. This grouping separates the records into categories such as:

2. Online Order

3. Walk-In Order

a. Below the grouping section, the Columns area shows the fields included in the report.

b. The columns added to the report are:

4. Customer Account Name

5. Date of Birthday is today?

6. Order Quantity

7. Type of Items

8. Total Bill

9. Products Purchased

a. The main report table displays the actual records from the Customer Accounts object.

b. The first record shown belongs to Nafiya, categorized under Online Order.

c. Nafiya's order details include:

10. Order Quantity: 5

11. Type of Items: Cookies, Gift Hampers

12. Total Bill: 1490.00

13. Products Purchased: Dry Fruit Biscuits, Fruit Biscuits, Multigrain Biscuits

a. The second record belongs to Shanthi, categorized under Walk-In Order.

b. Daniya's order details include:

14. Order Quantity: 2

15. Type of Items: Tea powder

16. Total Bill: 185.00

17. Products Purchased: Super Dust Tea Powder

a. The report automatically calculates Subtotals for each group and displays them under Online Orders and Walk-In Orders.

b. At the bottom of the report, a Grand Total row shows the combined values:

18. Total Order Quantity: 7

19. Total Bill Amount: 1675.00

a. Above the table, there is a donut chart visualization showing the Sum of Total Bill grouped by Record Type.

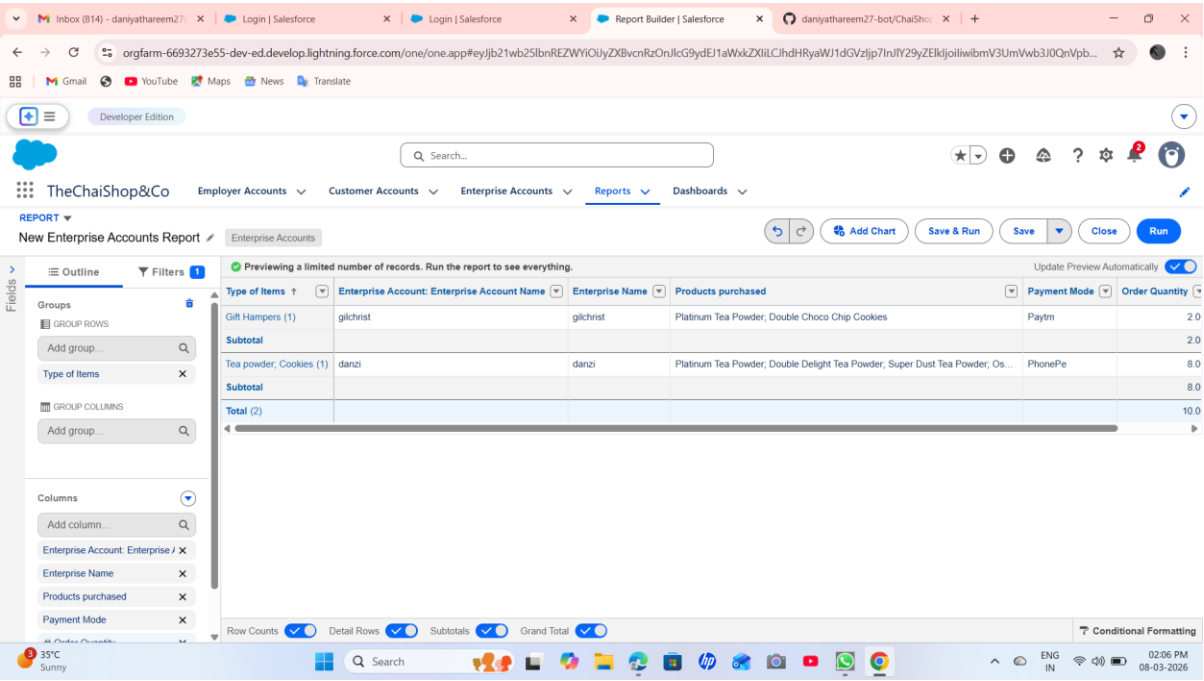
b. The chart visually compares revenue from:

20. Online Orders 21. Walk-In Orders

a. The value displayed in the center of the chart (1.7K) represents the total sales amount across all records.

b. The Filters tab (showing 1 filter) indicates that the report includes at least one filtering condition to limit which records appear.

c. At the bottom of the report settings, options such as Row Counts, Detail Rows, Subtotals, and Grand Total are enabled, allowing summarized data to be displayed.



1. This report is created in Salesforce Developer Edition under the Reports section for the company TheChaiShop&Co.

2. The report name is Enterprise Account Sales Report, which is designed to analyze sales made to Enterprise Accounts.

3. The report type used is Enterprise Accounts, meaning the data is pulled from enterprise-level customer accounts.

4. The report contains one filter, which controls what records are included in the analysis.

5. In the Group Rows section, records are grouped by Type of Items, allowing the report to categorize purchases based on item combinations.

6. The report currently shows two grouped categories: o Cookies; Gift Hampers o Tea powder; Gift Hampers

7. The Columns used in the report include:

o Enterprise Account Name – identifies which enterprise customer made the purchase.

o Total Bill – shows the total amount billed for the order.

o Products Purchased – lists the items included in the purchase.

8. The chart displayed above the table is a horizontal bar chart that visualizes the Sum of Total Bill for each item category.

9. In the first category (Cookies; Gift Hampers):

o Enterprise Account: jothi

o Total Bill: 1,755

o Products Purchased: Platinum Tea Powder, Osmania Biscuits (Premium Pack), Signature Box.

10. In the second category (Tea powder; Gift Hampers):

o Enterprise Account: hari o Total Bill: 2,500

o Products Purchased: Double Delight Tea Powder, Delight Box, Signature Box.

11. The Subtotal rows show the total sales amount for each item category.

12. The Total row at the bottom summarizes the entire report:

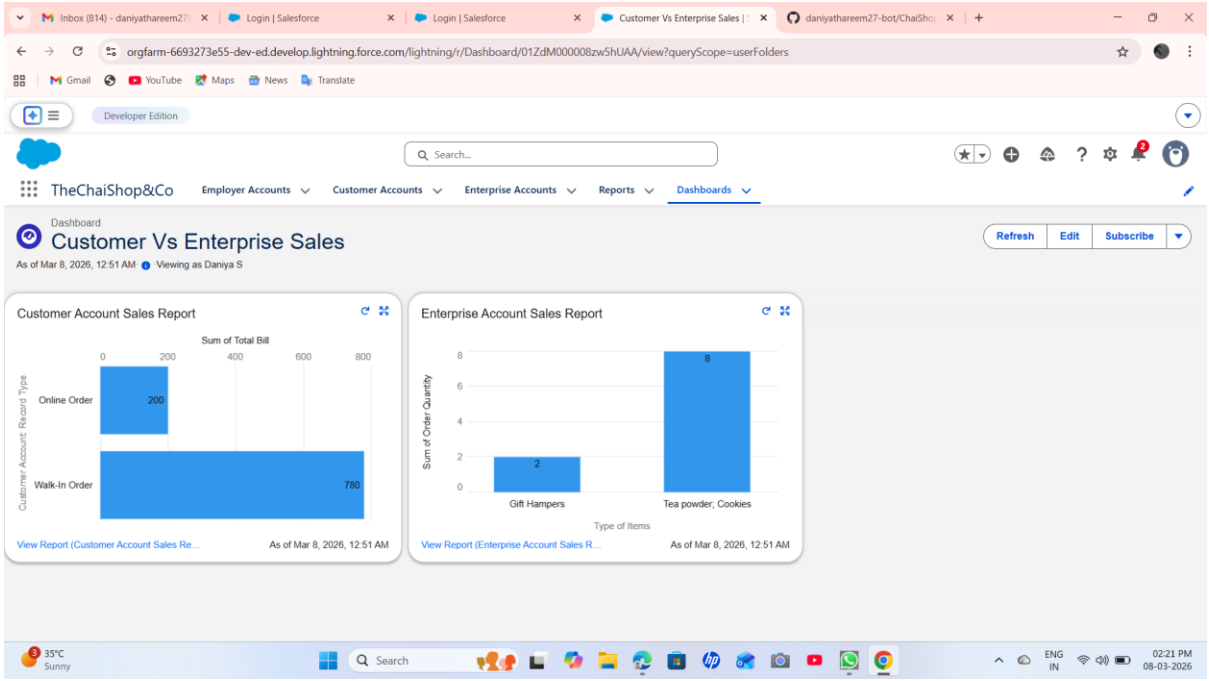
o Total Enterprise Accounts: 2

o Total Sales Amount: 4,255.

13. The preview message at the top indicates that only a limited number of records are currently displayed, and clicking Run will show the full dataset.

14. The Save & Run / Run buttons allow the user to save the report configuration and generate the complete report results.

15. Overall, this report helps the business analyze which combinations of products are purchased by enterprise customers and the revenue generated from each category



1. This dashboard is created in Salesforce Developer Edition for the organization TheChaiShop&Co.

2. The dashboard is titled Customer Vs Enterprise Sales, which is designed to compare sales between customer accounts and enterprise accounts.

3. The dashboard contains two main report components, each displaying sales data in a visual format for easier analysis.

4. The first component is the Customer Account Sales Report, which uses a donut chart to represent the sum of order quantity.

5. The donut chart categorizes orders based on Customer Account Record Type, which includes:

o Online Orders o Walk-In Orders

6. From the chart, the total number of orders is

7, where:

o 5 orders are Online Orders

o 2 orders are Walk-In Orders

7. This visualization helps the business understand which ordering method customers prefer.

8. The second component is the Enterprise Account Sales Report, which is displayed using a gauge chart.

9. The gauge chart represents the total enterprise sales value, showing the sum of total bill amounts generated from enterprise customers.

10. The gauge indicator currently points close to 4.3k, indicating the total revenue generated from enterprise accounts.

11. The gauge chart also visually represents performance ranges, helping users quickly understand whether the sales value is low, medium, or high.

12. Each dashboard component includes a View Report link, allowing users to open the detailed report behind the visualization.

13. At the top right of the dashboard, users can perform actions such as:

- Refresh to update data
- Edit to modify the dashboard layout
- Subscribe to receive scheduled updates.

14. The dashboard also shows the last updated timestamp, which is As of Mar 5, 2026, 6:30 AM.

15. Overall, this dashboard provides a quick visual comparison of customer sales activity and enterprise sales revenue, helping management monitor business performance efficiently.

Milestone 12 – Conclusion

In conclusion, the development of the CRM application for TheChaiShop&Co represents an important step toward improving business operations and customer relationship management. The system integrates employee details, customer information from both online and offline sources, and business data into a single platform, making daily operations more organized and efficient. The application

automates key processes such as managing sales records, calculating order quantities, and generating the total billing amount. This reduces manual errors and allows employees to focus more on providing better customer service. In addition, features like automated birthday email notifications help strengthen customer engagement and build stronger relationships.

Overall, the CRM system provides a reliable platform for managing customer interactions and improving business productivity for TheChaiShop&Co.

1. FUNCTIONAL & PERFORMANCE TESTING

During the testing phase, screenshots were captured from the Salesforce Lightning interface to verify correct system behavior. These include:

- Record creation for Employer, Customer, and Enterprise objects
- Validation rule testing for Aadhar, PAN, and phone numbers
- Verification of record types and page layouts
- Formula field validation for order quantity and billing
- Flow execution for birthday email alerts
- Report and dashboard generation

Performance testing ensured fast response time and system stability during concurrent usage.

2. ADVANTAGES & DISADVANTAGES

- Centralized data management Reduced manual work

- Automated calculations
- Improved customer engagement

Disadvantages

- Requires Salesforce license
- Internet dependency

3. Conclusion:

The CRM Application for TheChaiShop&Co successfully improves business operations by integrating customer data, automating billing, and enabling intelligent reporting. The system reduces errors, saves time, and enhances customer relationships through automation and analytics.

4. FUTURE SCOPE

- Mobile CRM integration
- AI-based sales prediction
- WhatsApp/SMS alerts
- Inventory management
- Multi-branch support
